Abstract
This document is for the person who installs, administers, and troubleshoots servers and storage systems. HP assumes you are qualified in the servicing of computer equipment and trained in recognizing hazards in products with hazardous energy levels.

Introduction

Server features

The HP ProLiant DL360p Gen8 SE Server comes with industry leading performance, efficiency, capacity, and reliability in a 1U space. The server provides enterprise-class design for performance workloads with versatile and future requirements, and it is ideal for low latency applications in a dense rack package.

The HP ProLiant DL360p Gen8 SE Server is a space-conscious, 2-processor performance server with industry leading feature sets. It is built to protect your investment with reliability, accessibility, and serviceability features designed in.

The server includes the following features:

- 8 SFF drive models available for 8 TB capacity, with optional DVD. 10 SFF drive model available for 10 TB capacity, without optional DVD.
- Intel Xeon E5-2600 or E5-2600v2 processor, with a choice of 2/4/6/8/10/12 cores, and speeds up to 3.5 GHz
- HP Smart Socket Guide for quick, precise intelligent processor installation
- 24 DIMM slots available for DDR3 Memory, and up to 1866 MHz speeds with 768 GB maximum capacity
- HP Smart Array P420i Controller with flash-backed write cache options
- HP FlexibleLOM options—4x1 Gb-E, 2x10 Gb-E, 2x1B and FlexFabric options
- 1 x16 (full height, half length) or x8 PCIe 3.0 slot; 1 x8 (1P) or x16 (2P) (low profile) PCIe 3.0 slot. For more information, see "Rear panel components (on page 10)."
- HP iLO Management Engine (HP iLO 4) with Active Health System, HP power/cooling management, Agentless Management, and Intelligent Provisioning

**IMPORTANT:** Due to thermal limitations, only one of the following components can be installed in a server at a time:
- 10 SFF drive cage
- LRDIMM
- E5-2687W processor

For more information about product features, specifications, options, configurations, and compatibility, see the product QuickSpecs on the HP Product Bulletin website (http://www.hp.com/go/productbulletin).

</tr>
<tr>
<td>S10</td>
<td>—</td>
<td>Reserved</td>
</tr>
<tr>
<td>S11</td>
<td>—</td>
<td>Reserved</td>
</tr>
<tr>
<td>S12</td>
<td>—</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

To access the redundant ROM, set S1, S5, and S6 to on.

When the system maintenance switch position 6 is set to the On position, the system is prepared to erase all system configuration settings from both CMOS and NVRAM.

⚠️ **CAUTION:** Clearing CMOS and/or NVRAM deletes configuration information. Be sure to properly configure the server or data loss could occur.

NMI jumper

The NMI jumper allows administrators to perform a memory dump before performing a hard reset. Crash dump analysis is an essential part of eliminating reliability problems, such as hangs or crashes in OSs, device drivers, and applications. Many crashes can freeze a system, requiring you to do a hard reset. Resetting the system erases any information that would support root cause analysis.

Systems running Microsoft® Windows® experience a blue-screen trap when the OS crashes. When this happens, Microsoft® recommends that system administrators perform an NMI event by temporarily shorting the NMI header with a jumper. The NMI event enables a hung system to become responsive again.
Systems Insight Display LEDs

The HP Systems Insight Display LEDs represent the system board layout. The display provides status for all internal LEDs and enables diagnosis with the access panel installed. To view the LEDs, access the HP Systems Insight Display (on page 21).

<table>
<thead>
<tr>
<th>Description</th>
<th>Status</th>
</tr>
</thead>
</table>
| Processor LEDs     | Off = Normal
                    Amber = Failed processor                                               |
| DIMM LEDs          | Off = Normal
                    Amber = Failed DIMM or configuration issue                            |
| Fan LEDs           | Off = Normal
                    Amber = Failed fan or missing fan                                        |
| NIC LEDs           | Off = No link to network
                    Solid green = Network link
                    Flashing green = Network link with activity
                    If power is off, the front panel LED is not active. For status, see "Rear panel LEDS and buttons (on page 11)."
| Power supply LEDs  | Off = Normal
                    Amber = Failed power supply                                             |
| PCI riser LED      | Off = Normal
                    Amber = Incorrectly installed PCI riser board                           |
| Over temp LED      | Off = Normal
                    Amber = High system temperature detected                                |
| AMP status LED     | Off = Disabled
                    Solid green = Advanced Memory Protection active
                    Solid amber = Memory failure has occurred.
                    Flashing amber = Invalid AMP memory configuration                      |
| Power cap LED      | Off = System is in standby, or no cap is set.
                    Solid green = Power cap applied                                          |

For more information, see "Systems Insight Display LED combinations (on page 16)."
Systems Insight Display LED combinations

When the health LED on the front panel illuminates either amber or red, the server is experiencing a health event. Combinations of illuminated Systems Insight Display LEDs, the system power LED, and the health LED indicate system status.

<table>
<thead>
<tr>
<th>Systems Insight Display LED and color</th>

<th>System power LED</th>
<th>Status</th>
</tr>
</thead>
</table>
| Processor (amber)                    | Red        | Amber            | One or more of the following conditions may exist:  
  • Processor in socket X has failed.  
  • Processor X is not installed in the socket.  
  • Processor X is unsupported.  
  • ROM detects a failed processor during POST. |
| Processor (amber)                    | Amber      | Green            | Processor in socket X is in a pre-failure condition. |
| DIMM (amber)                         | Red        | Green            | One or more DIMMs have failed. |
| DIMM (amber)                         | Amber      | Green            | DIMM in slot X is in a pre-failure condition. |
| Over temp (amber)                    | Amber      | Green            | The Health Driver has detected a cautionary temperature level. |
| Over temp (amber)                    | Red        | Amber            | The server has detected a hardware critical temperature level. |
| PCI riser (amber)                    | Red        | Green            | The PCI riser cage is not seated properly. |
| Fan (amber)                          | Amber      | Green            | One fan has failed or has been removed. |
| Fan (amber)                          | Red        | Green            | Two or more fans have failed or been removed. |
| Power supply (amber)                 | Red        | Amber            | One or more of the following conditions may exist:  
  • Only one power supply is installed and that power supply is in standby.  
  • Power supply fault  
  • System board fault |
| Power supply (amber)                 | Amber      | Green            | One or more of the following conditions may exist:  
  • Redundant power supply is installed and only one power supply is functional.  
  • AC power cord is not plugged into redundant power supply.  
  • Redundant power supply fault  
  • Power supply mismatch at POST or power supply mismatch through hot-plug addition |
| Power cap (off)                      | —          | Amber            | Standby |
| Power cap (green)                    | —          | Flashing green   | Waiting for power |
| Power cap (green)                    | —          | Green            | Power is available. |

**IMPORTANT:** If more than one DIMM slot LED is illuminated, further troubleshooting is required. Test each bank of DIMMs by removing all other DIMMs. Isolate the failed DIMM by replacing each DIMM in a bank with a known working DIMM.
Device numbers

- 4 LFF configuration

- 8 SFF configuration

- 10 SFF configuration

**IMPORTANT:** A cache module is required for a 10 SFF drive cage. Drives installed in a 10 SFF configuration do not function without a cache module.

For more information, see "Installing the cache module (on page 56)".

Fan modules

- One-processor configuration
When only one processor is installed, be sure the fan blanks are always installed in bays 1 and 2 to ensure proper cooling.

- Two-processor configuration
  Install fans 1 and 2 only when processor 2 is installed. When only one processor is installed, always install the fan blanks.
Operations

Power up the server

To power up the server, press the Power On/Standby button.

Power down the server

Before powering down the server for any upgrade or maintenance procedures, perform a backup of critical server data and programs.

IMPORTANT: When the server is in standby mode, auxiliary power is still being provided to the system.

To power down the server, use one of the following methods:

• Press and release the Power On/Standby button.
  This method initiates a controlled shutdown of applications and the OS before the server enters standby mode.

• Press and hold the Power On/Standby button for more than 4 seconds to force the server to enter standby mode.
  This method forces the server to enter standby mode without properly exiting applications and the OS.
  If an application stops responding, you can use this method to force a shutdown.

• Use a virtual power button selection through HP iLO.
  This method initiates a controlled remote shutdown of applications and the OS before the server enters standby mode.

Before proceeding, verify the server is in standby mode by observing that the system power LED is amber.

Extend the server from the rack

NOTE: If the optional cable management arm option is installed, you can extend the server without powering down the server or disconnecting peripheral cables and power cords. These steps are only necessary with the standard cable management solution.

1. Power down the server (on page 20).
2. Disconnect all peripheral cables and power cords.
3. Loosen the front panel thumbscrews.
4. Extend the server on the rack rails until the server rail-release latches engage.

WARNING: To reduce the risk of personal injury or equipment damage, be sure that the rack is adequately stabilized before extending a component from the rack.
WARNING: To reduce the risk of personal injury, be careful when pressing the server rail-release latches and sliding the server into the rack. The sliding rails could pinch your fingers.

5. After performing the installation or maintenance procedure, slide the server into the rack:
   a. Slide the server fully into the rack.
   b. Secure the server by tightening the thumbscrews.

6. Connect the peripheral cables and power cords.

Remove the server from the rack

To remove the server from an HP, Compaq branded, telco, or third-party rack:
1. Power down the server (on page 20).
2. Extend the server from the rack (on page 20).
3. Disconnect the cabling and remove the server from the rack. For more information, see the documentation that ships with the rack mounting option.
4. Place the server on a sturdy, level surface.

Access the HP Systems Insight Display

1. Press and release the display.
2. Extend the display from the chassis.
   o 8 SFF configuration
The display can be rotated up to 90 degrees.

- 10 SFF configuration
The display can be rotated up to 90 degrees.

Remove the access panel

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ **CAUTION:** Do not operate the server for long periods with the access panel open or removed. Operating the server in this manner results in improper airflow and improper cooling that can lead to thermal damage.

To remove the component:

1. Power down the server (on page 20).
2. Extend the server from the rack (on page 20).
3. Open or unlock the locking latch, slide the access panel to the rear of the chassis, and remove the access panel.

Install the access panel

1. Place the access panel on top of the server with the hood latch open. Allow the panel to extend past the rear of the server approximately 1.25 cm (0.5 in).
2. Push down on the hood latch. The access panel slides to a closed position.
3. Tighten the security screw on the hood latch.

Remove the FBWC capacitor pack

1. Power down the server (on page 20).
2. Remove all power:
   a. Disconnect each power cord from the power source.
b. Disconnect each power cord from the server.

3. Extend the server from the rack (on page 20).

4. Remove the access panel (on page 23).

5. Disconnect the cable from the cache module or PCIe controller.

6. Remove the FBWC capacitor pack.

---

Remove the PCI riser cage

⚠️ **CAUTION:** To prevent damage to the server or expansion boards, power down the server and remove all AC power cords before removing or installing the PCI riser cage.

1. Power down the server (on page 20).

2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.

3. Extend the server from the rack (on page 20).

4. Remove the access panel (on page 23).

5. Remove the PCI riser cage:
   a. Disconnect external cables connected to any existing expansion boards.
   b. Disengage the two PCI riser cage thumbscrews. Lift the tab, rotate 180 degrees, and the thumbscrew pops up.
   c. Lift the assembly to unseat the PCI riser boards, and then remove the cage.
The server may look different than the one shown in the following illustration, depending on the server model.

![Diagram of PCI riser cage installation]

Install the PCI riser cage

⚠️ **CAUTION:** To prevent damage to the server or expansion boards, power down the server and remove all AC power cords before removing or installing the PCI riser cage.

1. Power down the server (on page 20).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Extend the server from the rack (on page 20).
4. Remove the access panel (on page 23).
5. Align the PCI riser boards with the corresponding connectors on the system board, and then install the cage.
6. Push down on the thumbscrew and rotate 180 degrees.
7. Lower the tab.
The server may look different than the one shown in the following illustration, depending on the server model.

8. Install the access panel (on page 23).
9. Slide the server into the rack.
10. Connect each power cord to the server.
11. Connect each power cord to the power source.
12. Power up the server (on page 20).
Setup

Support and deployment services

Delivered by experienced, certified engineers, HP Care Pack services help you keep your servers up and running with support packages tailored specifically for HP ProLiant systems. HP Care Packs let you integrate both hardware and software support into a single package. A number of service level options are available to meet your needs.

HP Care Pack Services offer upgraded service levels to expand your standard product warranty with easy-to-buy, easy-to-use support packages that help you make the most of your server investments. Some of the Care Pack services are:

- Hardware support
  - 6-Hour Call-to-Repair
  - 4-Hour 24x7 Same Day
  - 4-Hour Same Business Day
- Software support
  - Microsoft®
  - Linux
  - HP ProLiant Essentials (HP SIM and RDP)
  - VMware
- Integrated hardware and software support
  - Proactive Care
  - Collaborative Support
  - Support Plus
  - Support Plus 24
- Startup and implementation services for both hardware and software

For more information on HP Care Pack Services, see the HP website (http://www.hp.com/services/carepack).

Optimum environment

When installing the server in a rack, select a location that meets the environmental standards described in this section.

Space and airflow requirements

To allow for servicing and adequate airflow, observe the following space and airflow requirements when deciding where to install a rack:
• Leave a minimum clearance of 63.5 cm (25 in) in front of the rack.
• Leave a minimum clearance of 76.2 cm (30 in) behind the rack.
• Leave a minimum clearance of 121.9 cm (48 in) from the back of the rack to the back of another rack or row of racks.

HP servers draw in cool air through the front and expel warm air through the rear. Therefore, the front and rear rack doors must be adequately ventilated to allow ambient room air to enter the cabinet, and the rear door must be adequately ventilated to allow the warm air to escape from the cabinet.

⚠️ **CAUTION:** To prevent improper cooling and damage to the equipment, do not block the ventilation openings.

When vertical space in the rack is not filled by a server or rack component, the gaps between the components cause changes in airflow through the rack and across the servers. Cover all gaps with blanking panels to maintain proper airflow.

⚠️ **CAUTION:** Always use blanking panels to fill empty vertical spaces in the rack. This arrangement ensures proper airflow. Using a rack without blanking panels results in improper cooling that can lead to thermal damage.

The 9000 and 10000 Series Racks provide proper server cooling from flow-through perforations in the front and rear doors that provide 64 percent open area for ventilation.

⚠️ **CAUTION:** When using a Compaq branded 7000 series rack, install the high airflow rack door insert (PN 327281-B21 for 42U rack, PN 157847-B21 for 22U rack) to provide proper front-to-back airflow and cooling.

⚠️ **CAUTION:** When using a Compaq branded 7000 series rack, install the high airflow rack door insert (PN 327281-B21 for 42U rack, PN 157847-B21 for 22U rack) to provide proper front-to-back airflow and cooling.

⚠️ **CAUTION:** If a third-party rack is used, observe the following additional requirements to ensure adequate airflow and to prevent damage to the equipment:

• Front and rear doors—If the 42U rack includes closing front and rear doors, you must allow 5,350 sq cm (830 sq in) of holes evenly distributed from top to bottom to permit adequate airflow (equivalent to the required 64 percent open area for ventilation).
• Side—The clearance between the installed rack component and the side panels of the rack must be a minimum of 7 cm (2.75 in).

### Temperature requirements

To ensure continued safe and reliable equipment operation, install or position the system in a well-ventilated, climate-controlled environment.

The maximum recommended ambient operating temperature (TMRA) for most server products is 35°C (95°F). The temperature in the room where the rack is located must not exceed 35°C (95°F).

⚠️ **CAUTION:** To reduce the risk of damage to the equipment when installing third-party options:

• Do not permit optional equipment to impede airflow around the server or to increase the internal rack temperature beyond the maximum allowable limits.
• Do not exceed the manufacturer’s TMRA.
Power requirements

Installation of this equipment must comply with local and regional electrical regulations governing the installation of information technology equipment by licensed electricians. This equipment is designed to operate in installations covered by NFPA 70, 1999 Edition (National Electric Code) and NFPA-75, 1992 (code for Protection of Electronic Computer/Data Processing Equipment). For electrical power ratings on options, refer to the product rating label or the user documentation supplied with that option.

⚠️ **WARNING:** To reduce the risk of personal injury, fire, or damage to the equipment, do not overload the AC supply branch circuit that provides power to the rack. Consult the electrical authority having jurisdiction over wiring and installation requirements of your facility.

⚠️ **CAUTION:** Protect the server from power fluctuations and temporary interruptions with a regulating uninterruptible power supply. This device protects the hardware from damage caused by power surges and voltage spikes and keeps the system in operation during a power failure.

When installing more than one server, you might need to use additional power distribution devices to safely provide power to all devices. Observe the following guidelines:

- Balance the server power load between available AC supply branch circuits.
- Do not allow the overall system AC current load to exceed 80% of the branch circuit AC current rating.
- Do not use common power outlet strips for this equipment.
- Provide a separate electrical circuit for the server.

For more information on the hot-plug power supply and calculators to determine server power consumption in various system configurations, see the HP Power Advisor website (http://www.hp.com/go/hppoweradvisor).

Electrical grounding requirements

The server must be grounded properly for proper operation and safety. In the United States, you must install the equipment in accordance with NFPA 70, 1999 Edition (National Electric Code), Article 250, as well as any local and regional building codes. In Canada, you must install the equipment in accordance with Canadian Standards Association, CSA C22.1, Canadian Electrical Code. In all other countries, you must install the equipment in accordance with any regional or national electrical wiring codes, such as the International Electrotechnical Commission (IEC) Code 364, parts 1 through 7. Furthermore, you must be sure that all power distribution devices used in the installation, such as branch wiring and receptacles, are listed or certified grounding-type devices.

Because of the high ground-leakage currents associated with multiple servers connected to the same power source, HP recommends the use of a PDU that is either permanently wired to the building’s branch circuit or includes a nondetachable cord that is wired to an industrial-style plug. NEMA locking-style plugs or those complying with IEC 60309 are considered suitable for this purpose. Using common power outlet strips for the server is not recommended.

Connecting a DC power cable to a DC power source
WARNING: To reduce the risk of electric shock or energy hazards:

- This equipment must be installed by trained service personnel, as defined by the NEC and IEC 60950-1, Second Edition, the standard for Safety of Information Technology Equipment.
- Connect the equipment to a reliably grounded SELV source. An SELV source is a secondary circuit that is designed so normal and single fault conditions do not cause the voltages to exceed a safe level (60 V direct current).
- The branch circuit overcurrent protection must be rated 20A.

WARNING: When installing a DC power supply, the ground wire must be connected before the positive or negative leads.

WARNING: Remove power from the power supply before performing any installation steps or maintenance on the power supply.

CAUTION: The server equipment connects the earthed conductor of the DC supply circuit to the earthing conductor at the equipment. For more information, see the HP 750W Common Slot -48V DC Input Hot-Plug Power Supply Kit Installation Instructions.

CAUTION: If the DC connection exists between the earthed conductor of the DC supply circuit and the earthing conductor at the server equipment, the following conditions must be met:

- This equipment must be connected directly to the DC supply system earthing electrode conductor or to a bonding jumper from an earthing terminal bar or bus to which the DC supply system earthing electrode conductor is connected.
- This equipment should be located in the same immediate area (such as adjacent cabinets) as any other equipment that has a connection between the earthed conductor of the same DC supply circuit and the earthing conductor, and also the point of earthing of the DC system. The DC system should be earthed elsewhere.
- The DC supply source is to be located within the same premises as the equipment.
- Switching or disconnecting devices should not be in the earthed circuit conductor between the DC source and the point of connection of the earthing electrode conductor.

To connect a DC power cable to a DC power source:

1. Cut the DC power cord ends no shorter than 150 cm (59.06 in).
2. If the power source requires ring tongues, use a crimping tool to install the ring tongues on the power cord wires.

   IMPORTANT: The ring tongues must be UL approved and accommodate 12 gauge wires.

   IMPORTANT: The minimum nominal thread diameter of a pillar or stud type terminal must be 3.5 mm (0.138 in); the diameter of a screw type terminal must be 4.0 mm (0.157 in).

3. Stack each same-colored pair of wires and then attach them to the same power source. The power cord consists of three wires (black, red, and green).

For more information, see the HP 750W Common Slot -48V DC Input Hot-Plug Power Supply Installation Instructions.

Rack warnings
WARNING: To reduce the risk of personal injury or damage to the equipment, be sure that:
- The leveling jacks are extended to the floor.
- The full weight of the rack rests on the leveling jacks.
- The stabilizing feet are attached to the rack if it is a single-rack installation.
- The racks are coupled together in multiple-rack installations.
- Only one component is extended at a time. A rack may become unstable if more than one component is extended for any reason.

WARNING: To reduce the risk of personal injury or equipment damage when unloading a rack:
- At least two people are needed to safely unload the rack from the pallet. An empty 42U rack can weigh as much as 115 kg (253 lb), can stand more than 2.1 m (7 ft) tall, and might become unstable when being moved on its casters.
- Never stand in front of the rack when it is rolling down the ramp from the pallet. Always handle the rack from both sides.

Contents of the server shipping carton

Unpack the server shipping carton and locate the materials and documentation necessary for installing the server. All the rack mounting hardware necessary for installing the server into the rack is included with the rack or the server.

The contents of the server shipping carton include:
- Server
- Power cord
- Printed setup documentation, Documentation CD, and software products
- Rack mounting hardware kit and documentation

In addition to these supplied items, you might need:
- Screwdriver
- Hardware options
- Operating system or application software

Installing hardware options

Install any hardware options before initializing the server. For options installation information, refer to the option documentation. For server-specific information, refer to "Hardware options installation (on page 35)."

Installing the server into the rack

To install the server into a rack with square, round, or threaded holes, refer to the instructions that ship with the rack hardware kit.

If you are installing the server into a telco rack, order the appropriate option kit at the RackSolutions.com website (http://www.racksolutions.com/hp). Follow the server-specific instructions on the website to install the rack brackets.

Use the following information when connecting peripheral cables and power cords to the server.
**WARNING:** This server is very heavy. To reduce the risk of personal injury or damage to the equipment:

- Observe local occupational health and safety requirements and guidelines for manual material handling.
- Get help to lift and stabilize the product during installation or removal, especially when the product is not fastened to the rails. HP recommends that a minimum of two people are required for all rack server installations. A third person may be required to help align the server if the server is installed higher than chest level.
- Use caution when installing the server in or removing the server from the rack; it is unstable when not fastened to the rails.

**CAUTION:** Always plan the rack installation so that the heaviest item is on the bottom of the rack. Install the heaviest item first, and continue to populate the rack from the bottom to the top.

1. Install the server and cable management arm into the rack. See the installation instructions that ship with the selected rail system.
2. Connect the peripheral devices to the server.

3. Connect the power cord to the server.
4. Use the strain relief clip from the server hardware kit to secure the power cord.

5. Connect the power cord to the power source.

**Powering on and selecting boot options**

1. Connect the Ethernet cable.
2. Press the Power On/Standby button.
3. During the initial boot:
   - To modify the server configuration ROM default settings, press **F9** when prompted from the start up sequence to enter the RBSU. By default, RBSU runs in the English language.
   - If you do not need to modify the server configuration and are ready to install the system software, press **F10** to access Intelligent Provisioning.

**NOTE:** If an HP Smart Array controller has been added or is embedded in the system, the controller defaults to a RAID configuration based on the size and number of hard drives installed. For more information on modifying the controller default settings, see the documentation on the Documentation CD.

For more information on automatic configuration, see the *HP ROM-Based Setup Utility User Guide* on the Documentation CD or the iLO Management Engine Information Library (http://www.hp.com/go/ilomgmtengine/docs).

**Installing the operating system**

This HP ProLiant server does not ship with provisioning media. Everything needed to manage and install the system software and firmware is preloaded on the server.

To operate properly, the server must have a supported operating system. For the latest information on operating system support, see the HP website (http://www.hp.com/go/supportos).

To install an operating system on the server, use one of the following methods:
Intelligent Provisioning—The iLO Management Engine is a new feature on ProLiant servers that contains Intelligent Provisioning for embedded deployment, updating, and provisioning capabilities. Intelligent Provisioning can configure the server and install an operating system, eliminating the need for SmartStart CDs and Smart Update Firmware DVDs.

To install an operating system on the server with Intelligent Provisioning (local or remote):

a. Connect the Ethernet cable between the network connector on the server and a network jack.

b. Press the Power On/Standby button.

c. During server POST, press the **F10** key.

d. Complete the initial Preferences and Registration portion of Intelligent Provisioning (on page 80).

e. At the 1 Start screen, click the **Configure and Install** button.

f. To finish the installation, follow the onscreen prompts. An Internet connection is required to update the firmware and systems software.

Remote deployment installation—To deploy an operating system remotely, use Insight Control server deployment for an automated solution.

For additional system software and firmware updates, download the HP Service Pack for ProLiant from the HP website (http://www.hp.com/go/spp/download). Software and firmware must be updated before using the server for the first time, unless any installed software or components require an older version. For more information, see "Keeping the system current (on page 88)."

For more information on using these installation methods, see the HP website (http://www.hp.com/go/ilo).

Registering the server

To experience quicker service and more efficient support, register the product at the HP Product Registration website (http://register.hp.com).
Hardware options installation

Introduction

If more than one option is being installed, read the installation instructions for all the hardware options and identify similar steps to streamline the installation process.

⚠️ WARNING: To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ CAUTION: To prevent damage to electrical components, properly ground the server before beginning any installation procedure. Improper grounding can cause electrostatic discharge.

Processor and fan module option

Install fans 1 and 2 only when processor 2 is installed. When only one processor is installed, install the fan blanks in bays 1 and 2 (“Fan modules” on page 18).

⚠️ WARNING: To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

⚠️ CAUTION: To prevent possible server malfunction and damage to the equipment, multiprocessor configurations must contain processors with the same part number.

⚠️ CAUTION: The heatsink thermal interface media is not reusable and must be replaced if the heatsink is removed from the processor after it has been installed.

⚠️ CAUTION: To prevent possible server overheating, always populate processor socket 2 with a processor and a heatsink or a processor socket cover and a heatsink blank.

⚠️ IMPORTANT: Processor socket 1 must be populated at all times or the server does not function.

To install the processor and fan:

1. Update the system ROM.
   Locate and download the latest ROM version from the HP website (http://www.hp.com/support). Follow the instructions on the website to update the system ROM.
2. Power down the server (on page 20).
3. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
4. Extend the server from the rack (on page 20).
5. Remove the access panel (on page 23).
6. Remove the heatsink blank:
   - Caged heatsink blank
   - Screw-down heatsink blank
7. Open each of the processor locking levers in the order indicated, and then open the processor retaining bracket.

8. Remove the clear processor socket cover. Retain the processor socket cover for future use.
9. Install the processor. Verify that the processor is fully seated in the processor retaining bracket by visually inspecting the processor installation guides on either side of the processor. **THE PINS ON THE SYSTEM BOARD ARE VERY FRAGILE AND EASILY DAMAGED.**

![Processor Installation Diagram]

⚠️ **CAUTION:** THE PINS ON THE SYSTEM BOARD ARE VERY FRAGILE AND EASILY DAMAGED. To avoid damage to the system board, do not touch the processor or the processor socket contacts.

10. Close the processor retaining bracket. When the processor is installed properly inside the processor retaining bracket, the processor retaining bracket clears the flange on the front of the socket.

⚠️ **CAUTION:** Do not press down on the processor. Pressing down on the processor may cause damage to the processor socket and the system board. Press only in the area indicated on the processor retaining bracket.
11. Press and hold the processor retaining bracket in place, and then close each processor locking lever. Press only in the area indicated on the processor retaining bracket.

12. Remove the thermal interface protective cover from the heatsink.

13. Install the heatsink, aligning the guide pins and cutouts on the front of the heatsink:
- Caged heatsink

- Screw-down heatsink
14. Remove the fan blanks.

15. Install the fans:

⚠️ CAUTION: To avoid thermal shutdown, all fans must be installed in a dual processor configuration.

- For fans with latches, do the following:
  a. Install the fans into slots 1 and 2.
b. Secure the locking latches.

- For fans without latches, install the fans into slots 1 and 2.

16. Install the access panel (on page 23).
17. Slide the server into the rack.
18. Connect each power cord to the server.
19. Connect each power cord to the power source.
20. Power up the server (on page 20).

Memory options

**IMPORTANT:** This server does not support mixing LRDIMMs, RDIMMs, or UDIMMs. Attempting to mix any combination of these DIMMs can cause the server to halt during BIOS initialization.

The memory subsystem in this server can support LRDIMMs, RDIMMs, or UDIMMs:
- UDIMMs represent the most basic type of memory module and offer lower latency in one DIMM per channel configurations and (relatively) low power consumption, but are limited in capacity.
- RDIMMs offer larger capacities than UDIMMs and include address parity protection.
- LRDIMMs support higher densities than single- and dual-rank RDIMMs, and higher speeds than quad-rank RDIMMs. This support enables you to install more high capacity DIMMs, resulting in higher system capacities and higher bandwidth.

**IMPORTANT:** Due to thermal limitations, only one of the following components can be installed in a server at a time:
- 10 SFF drive cage
- LRDIMM
- E5-2687W processor

All types are referred to as DIMMs when the information applies to all types. When specified as LRDIMM, RDIMM, or UDIMM the information applies to that type only. All memory installed in the server must be the same type.

The server supports the following DIMM speeds:
- Single- and dual-rank PC3-10600 (DDR3-1333) RDIMMs operating at up to 1333 MT/s
- Single- and dual-rank PC3-12800 (DDR3-1600) RDIMMs operating at up to 1600 MT/s
- Single- and dual-rank PC3L-12800 (DDR3-1600) RDIMMs operating at up to 1600 MT/s
- Single- and dual-rank PC3-10600 (DDR3-1333) UDIMMs operating at up to 1333 MT/s
- Single- and dual-rank PC3-14900R (DDR3-1866) RDIMMs operating at up to 1866 MT/s
- Quad-rank PC3L-10600 (DDR3-1333) LRDIMMs, operating as dual-rank DIMMs, at up to 1333 MT/s
- Quad-rank PC3L-14900 (DDR3-1866) LRDIMMs, operating as dual-rank DIMMs, at up to 1600 MT/s

### Speed, voltage, and capacity

</table>

Depending on the processor model, the number of DIMMs installed, and whether LRDIMMs, UDIMMs, or RDIMMs are installed, the memory clock speed can be reduced to 1866 MT/s, 1600 MT/s, 1333 MT/s, 1066 MT/s, or 800 MT/s.

1 RDIMM supports 1.35V 3DPC at 1066/800 MT/s, using HP SmartMemory. Third-party memory supports 1.5V 3DPC at 1066/800 MT/s.
2 HP SmartMemory LRDIMM supports 1.35V or 1.5V 1DPC or 2DPC at 1333 MT/s. Third-party memory supports 1.5V 1DPC or 2DPC at 1333 MT/s, or 1.35V 1DPC or 2DPC at 1066 MT/s.
3 UDIMM is supported at 1.35V 1DPC or 2DPC at 1333/1600 MT/s using HP SmartMemory only. Third-party memory supports 1.35V 1DPC or 2DPC at 1066 MT/s, or 1.5V 1DPC or 2DPC at 1333 MT/s.
4 For E5-2600v2

**HP SmartMemory**

HP SmartMemory, introduced for Gen8 servers, authenticates and unlocks certain features available only on HP Qualified memory and verifies whether installed memory has passed HP qualification and test processes. Qualified memory is performance-tuned for HP ProLiant and BladeSystem servers and provides future enhanced support through HP Active Health and manageability software.

Certain performance features are unique with HP SmartMemory. While the industry supports DDR3-1333 RDIMM at 1.5V, this Gen8 server supports DDR3-1333 RDIMM up to 3 DIMMs per channel at 1066 MT/s running at 1.35V. This equates to up to 20% less power at the DIMM level with no performance penalty. In addition, the industry supports UDIMM at 2 DIMMs per channel at 1.35V at 1066 MT/s. HP SmartMemory supports 2 DIMMs per channel at 1333 MT/s, or 25% greater bandwidth.

The 1333 MHz support for 3DPC PC3-10600H HP SmartMemory feature can be enabled through RBSU to enable HP SmartMemory 1600 RDIMMs to run at 1.5V 3DPC at 1333 MT/s.

**Memory subsystem architecture**

The memory subsystem in this server is divided into channels. Each processor supports four channels, and each channel supports three DIMM slots, as shown in the following table.

<table>
<thead>
<tr>
<th>Channel</th>
<th>Population order</th>
<th>Slot number</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A</td>
<td>12</td>

<td>I</td>
<td>10</td>
</tr>
</tbody>
</table>
### Single-, dual-, and quad-rank DIMMs

To understand and configure memory protection modes properly, an understanding of single-, dual-, and quad-rank DIMMs is helpful. Some DIMM configuration requirements are based on these classifications.

A single-rank DIMM has one set of memory chips that is accessed while writing to or reading from the memory. A dual-rank DIMM is similar to having two single-rank DIMMs on the same module, with only one rank accessible at a time. A quad-rank DIMM is, effectively, two dual-rank DIMMs on the same module. Only one rank is accessible at a time. The server memory control subsystem selects the proper rank within the DIMM when writing to or reading from the DIMM.

Dual- and quad-rank DIMMs provide the greatest capacity with the existing memory technology. For example, if current DRAM technology supports 8-GB single-rank DIMMs, a dual-rank DIMM would be 16 GB, and a quad-rank DIMM would be 32 GB.

LRDIMMs are labeled as quad-rank DIMMs; however, they function more like dual-rank DIMMs. There are four ranks of DRAM on the DIMM, but the LRDIMM buffer creates an abstraction that allows the DIMM to appear as a dual-rank DIMM to the system. The LRDIMM buffer also isolates the electrical loading of the DRAM from the system to allow for faster operation. These two changes allow the system to support up to three LRDIMMs per memory channel, providing for up to 50% greater memory capacity and higher memory operating speed compared to quad-rank RDIMMs.

<table>
<thead>
<tr>
<th>Channel</th>
<th>Population order</th>
<th>Slot number</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>B, F, J</td>
<td>9, 8, 7</td>
</tr>
<tr>
<td>3</td>
<td>C, G, K</td>
<td>1, 2, 3</td>
</tr>
<tr>
<td>4</td>
<td>D, H, L</td>
<td>4, 5, 6</td>
</tr>
</tbody>
</table>

For the location of the slot numbers, see “DIMM slot locations ("DIMM slots" on page 13).”

This multi-channel architecture provides enhanced performance in Advanced ECC mode. This architecture also enables Lockstep and Online Spare Memory modes.

DIMM slots in this server are identified by number and by letter. Letters identify the population order. Slot numbers indicate the DIMM slot ID for spare replacement.
DIMM identification

To determine DIMM characteristics, use the label attached to the DIMM and the following illustration and table.

![DIMM label](image)

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

           E = UDIMM (unbuffered with ECC)  
           L = LRDIMM (load reduced) |

For the latest supported memory information, see the QuickSpecs on the HP website ([http://h18000.www1.hp.com/products/quickspecs/ProductBulletin.html](http://h18000.www1.hp.com/products/quickspecs/ProductBulletin.html)). At the website, choose the geographic region, and then locate the product by name or product category.

Memory configurations

To optimize server availability, the server supports the following AMP modes:

- Advanced ECC—provides up to 4-bit error correction and enhanced performance over Lockstep mode. This mode is the default option for this server.
• Online spare memory—provides protection against failing or degraded DIMMs. Certain memory is reserved as spare, and automatic failover to spare memory occurs when the system detects a DIMM that is degrading. This allows DIMMs that have a higher probability of receiving an uncorrectable memory error (which would result in system downtime) to be removed from operation.

Advanced Memory Protection options are configured in RBSU. If the requested AMP mode is not supported by the installed DIMM configuration, the server boots in Advanced ECC mode. For more information, see “HP ROM-Based Setup Utility (on page 83).”

The server also can operate in independent channel mode or combined channel mode (lockstep). When running in lockstep mode, you gain reliability in one of two ways:

• If running with UDIMMs (built with x8 DRAM devices), the system can survive a complete DRAM failure (SDDC). In independent channel mode, this failure would be an uncorrectable error.

• If running with RDIMM (built with x4 DRAM devices), the system can survive the complete failure of two DRAM devices (DDDC). Running in independent mode, the server can only survive the complete failure of a single DRAM device (SDDC).

### Maximum capacity

</tbody>
</table>

For the latest memory configuration information, see the QuickSpecs on the HP website (http://www.hp.com).

### Advanced ECC memory configuration

Advanced ECC memory is the default memory protection mode for this server. Standard ECC can correct single-bit memory errors and detect multi-bit memory errors. When multi-bit errors are detected using Standard ECC, the error is signaled to the server and causes the server to halt.

Advanced ECC protects the server against some multi-bit memory errors. Advanced ECC can correct both single-bit memory errors and 4-bit memory errors if all failed bits are on the same DRAM device on the DIMM.

Advanced ECC provides additional protection over Standard ECC because it is possible to correct certain memory errors that would otherwise be uncorrected and result in a server failure. Using HP Advanced Memory Error Detection technology, the server provides notification when a DIMM is degrading and has a higher probability of uncorrectable memory error.

### Online Spare memory configuration

Online spare memory provides protection against degraded DIMMs by reducing the likelihood of uncorrected memory errors. This protection is available without any operating system support.

Online spare memory protection dedicates one rank of each memory channel for use as spare memory. The remaining ranks are available for OS and application use. If correctable memory errors occur at a rate higher than a specific threshold on any of the non-spare ranks, the server automatically copies the memory contents of the degraded rank to the online spare rank. The server then deactivates the failing rank and automatically switches over to the online spare rank.
Lockstep memory configuration

Lockstep mode provides protection against multi-bit memory errors that occur on the same DRAM device. Lockstep mode can correct any single DRAM device failure on x4 and x8 DIMM types. The DIMMs in each channel must have identical HP part numbers.

General DIMM slot population guidelines

Observe the following guidelines for all AMP modes:

- Install DIMMs only if the corresponding processor is installed.
- When two processors are installed, balance the DIMMs across the two processors.
- White DIMM slots denote the first slot of a channel (Ch 1-A, Ch 2-B, Ch 3-C, Ch 4-D).
- Do not mix LRDIMMs, UDIMMs, RDIMMs, or HDIMMs.
- Do not install more than two UDIMMs per channel. UDIMMs should not be installed in slots Ch 1-I, Ch 2-J, Ch 3-K, or Ch 4-L.
- HDIMMs require 12 DIMMs per processor.
- When two processors are installed, install the DIMMs in sequential alphabetical order balanced between the two processors: P1-A, P2-A, P1-B, P2-B, P1-C, P2-C, and so on.

For detailed memory configuration rules and guidelines, use the Online DDR3 Memory Configuration Tool on the HP website (http://www.hp.com/go/ddr3memory-configurator).

DIMM speeds are supported as indicated in the following table.

<table>
<thead>
<tr>
<th>Populated slots (per channel)</th>
<th>Rank</th>
<th>Speeds supported (MT/s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Single- or dual-rank</td>

</tr>
<tr>
<td>3</td>
<td>Single- or dual-rank</td>
<td>800, 1066, 1333</td>
</tr>
</tbody>
</table>

Advanced ECC population guidelines

For Advanced ECC mode configurations, observe the following guidelines:

- Observe the general DIMM slot population guidelines.
- DIMMs may be installed individually.

Online spare population

For Online Spare memory mode configurations, observe the following guidelines:

- Observe the general DIMM slot population guidelines.
- Each channel must have a valid online spare configuration.
- Each channel can have a different valid online spare configuration.
- Each populated channel must have a spare rank:
  - A single dual-rank DIMM is not a valid configuration.
- LRDIMMs are treated as dual-rank DIMMs.

**Lockstep Memory population guidelines**

For Lockstep memory mode configurations, observe the following guidelines:

- Observe the general DIMM slot population guidelines.
- DIMM configuration on all channels of a processor must be identical.
- In multi-processor configurations, each processor must have a valid Lockstep Memory configuration.
- In multi-processor configurations, each processor may have a different valid Lockstep Memory configuration.

**Population order**

For memory configurations with a single processor or multiple processors, populate the DIMM slots in the following order:

- LRDIMM: Sequentially in alphabetical order (A through L)
- RDIMM: Sequentially in alphabetical order (A through L)
- UDIMM: A through H, sequentially in alphabetical order. Do not populate DIMM slots I through L.

After installing the DIMMs, use RBSU to configure Advanced ECC, online spare, or lockstep memory support.

**Installing a DIMM**

The server supports up to 24 DIMMs. To install a DIMM:

1. Power down the server (on page 20).
2. Remove all power:
   - a. Disconnect each power cord from the power source.
   - b. Disconnect each power cord from the server.
3. Extend the server from the rack (on page 20).
4. Remove the access panel (on page 23).
5. Open the DIMM slot latches.
6. Install the DIMM.

7. Install the access panel (on page 23).

8. Slide the server into the rack.

9. Connect each power cord to the server.

10. Connect each power cord to the power source.

11. Power up the server (on page 20).

Use RBSU ("HP ROM-Based Setup Utility" on page 83) to configure the memory mode.

For more information about LEDs and troubleshooting failed DIMMs, see "Systems Insight Display LED combinations (on page 16)."

Hot-plug hard drive guidelines

When adding hard drives to the server, observe the following general guidelines:

- The system automatically sets all device numbers.
- If only one hard drive is used, install it in the bay with the lowest device number ("Device numbers" on page 17).
- Drives should be the same capacity to provide the greatest storage space efficiency when drives are grouped together into the same drive array.
Removing the hard drive blank

Remove the component as indicated.

Installing a hot-plug hard drive

The server can support 4 hard drives in an LFF configuration, or 8 or 10 hard drives in an SFF configuration.

To install the component:
1. Remove the drive blank.
2. Prepare the drive.
3. Install the drive.

4. Determine the status of the drive from the drive LED definitions ("Hot-plug drive LED definitions" on page 18).

**DVD-ROM and DVD-RW drive option**

All configurations of this server, except the 10 SFF drive configuration, support the installation of a DVD-ROM drive or a DVD-RW drive.

To install the component:

1. Power down the server (on page 20).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Extend the server from the rack (on page 20).
4. Remove the access panel (on page 23).

⚠️ **WARNING:** Eliminate the risk of electric shock by removing all AC power from the system before installing or replacing any non-hot-plug hardware option. Disconnect all power cords to completely remove power from the server.

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.
5. Remove the bezel blank from the DVD-ROM bay.

6. For an SFF DVD drive, do the following:
   
   The server may look different than the one shown in the following illustrations, depending on the server model.
   
   a. Install the DVD drive using the screws from this kit and a T-10/T-15 Torx screwdriver.
b. Connect the cable to the rear of the drive and to the SATA DVD-ROM drive connector on the system board.

c. Clip the cable to the power supply air baffle when routing it along the edge of the system board.

7. For an LFF DVD drive, do the following:
a. Connect the cable to the rear of the DVD drive, and then route the cable through the DVD drive bay.

b. Install the DVD drive.

c. Route and connect the other end of the cable to the SATA DVD-ROM drive connector on the system board, using the same steps provided for the SFF DVD-ROM drive.

8. Install the access panel (on page 23).
9. Slide the server into the rack.
10. Connect each power cord to the server.
11. Connect each power cord to the power source.
12. Power up the server (on page 20).

**Controller options**

The server ships with an embedded Smart Array P420i controller. For more information about the controller and its features, see the *HP Smart Array Controllers for HP ProLiant Servers User Guide* on the HP website.
Upgrade options exist for the integrated array controller. For a list of supported options, see the QuickSpecs on the HP website (http://www.hp.com/support).

The server supports FBWC. FBWC consists of a cache module and a capacitor pack. The DDR cache module buffers and stores data being written by the controller. When the system is powered on, the capacitor pack charges fully in about 5 minutes. In the event of a system power failure, a fully charged capacitor pack provides power for up to 80 seconds. During that interval, the controller transfers the cached data from DDR memory to flash memory, where the data remains indefinitely or until a controller retrieves the data.

**CAUTION:** The cache module connector does not use the industry-standard DDR3 mini-DIMMs. Do not use the controller with cache modules designed for other controller models, because the controller can malfunction and you can lose data. Also, do not transfer this cache module to an unsupported controller model, because you can lose data.

**CAUTION:** To prevent a server malfunction or damage to the equipment, do not add or remove the battery pack while an array capacity expansion, RAID level migration, or stripe size migration is in progress.

**CAUTION:** After the server is powered down, wait 15 seconds and then check the amber LED before unplugging the cable from the cache module. If the amber LED blinks after 15 seconds, do not remove the cable from the cache module. The cache module is backing up data, and data is lost if the cable is detached.

**IMPORTANT:** The battery pack might have a low charge when installed. In this case, a POST error message is displayed when the server is powered up, indicating that the battery pack is temporarily disabled. No action is necessary on your part. The internal circuitry automatically recharges the batteries and enables the battery pack. This process might take up to four hours. During this time, the cache module functions properly, but without the performance advantage of the battery pack.

**NOTE:** The data protection and the time limit also apply if a power outage occurs. When power is restored to the system, an initialization process writes the preserved data to the hard drives.

## Installing the cache module

**CAUTION:** In systems that use external data storage, be sure that the server is the first unit to be powered down and the last to be powered back up. Taking this precaution ensures that the system does not erroneously mark the drives as failed when the server is powered up.

**IMPORTANT:** A cache module is required for a 10 SFF drive cage. Drives installed in a 10 SFF configuration do not function without a cache module.

To install the component:

1. Power down the server (on page 20).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Extend the server from the rack (on page 20).
4. Remove the access panel (on page 23).
5. Remove the PCI riser cage (on page 24).
6. Install the cache module in the SAS cache module connector on the system board. For connector locations, see "System board components (on page 12)."

7. Install the PCI riser cage (on page 25).
8. Install the access panel (on page 23).
9. Slide the server into the rack.
10. Connect each power cord to the server.
11. Connect each power cord to the power source.
12. Power up the server (on page 20).

Installing the FBWC capacitor pack

1. Power down the server (on page 20).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Extend the server from the rack (on page 20).
4. Remove the access panel (on page 23).
5. Remove the PCI riser cage (on page 24).
6. Install the cache module ("Installing the cache module" on page 56).

⚠️ **CAUTION:** When connecting or disconnecting the capacitor pack cable, the connectors on the cache module and cable are susceptible to damage. Avoid excessive force and use caution to avoid damage to these connectors.

7. Install the FBWC capacitor pack, and then connect the FBWC cable to the cache module.
The second (left) capacitor pack cable connects to an optional Smart Array expansion board.

8. Install the PCI riser cage (on page 25).
9. Install the access panel (on page 23).
10. Slide the server into the rack.
11. Connect each power cord to the server.
12. Connect each power cord to the power source.
13. Power up the server (on page 20).

Front video adapter option

Depending on the model purchased, the server may look different than shown.

The 10 SFF drive configuration does not support the front video adapter.

To install the component:
1. Connect the front video adapter to the front video connector.

⚠️ **CAUTION:** Be sure to connect the video adapter to the video connector, and not to the USB connector.
2. Connect the front video adapter to the video device.

To remove the front video adapter, squeeze the top and bottom together to release the locking mechanism.

FlexibleLOM option

⚠️ **WARNING:** To reduce the risk of personal injury, electric shock, or damage to the equipment, remove the power cord to remove power from the server. The front panel Power On/Standby button does not completely shut off system power. Portions of the power supply and some internal circuitry remain active until AC power is removed.

1. Power down the server (on page 20).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Remove any attached network cables.
4. Extend the server from the rack (on page 20).
5. Remove the access panel (on page 23).
6. Loosen the thumbscrew.
7. Remove the existing FlexibleLOM.

To replace the component:

1. Firmly seat the FlexibleLOM in the slot, and then tighten the thumbscrew.

2. Install the access panel (on page 23).
3. Slide the server into the rack.
4. Connect the LAN segment cables.
5. Connect each power cord to the server.
6. Connect each power cord to the power source.
Expansion board option

The server ships with PCIe riser boards and expansion slots. PCIe expansion boards are supported with optional riser boards.

IMPORTANT: Be sure you are using a supported expansion board. For information on supported expansion boards, see the QuickSpecs on the HP website (http://www.hp.com/support).

To install the component:

1. Power down the server (on page 20).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Extend the server from the rack (on page 20).
4. Remove the access panel (on page 23).
5. Remove the PCIe riser cage ("Remove the PCI riser cage" on page 24).
6. Remove the expansion slot cover from the PCIe riser cage.
7. Install the expansion board into the slot until it seats firmly. (The same step applies for installing an expansion board in PCIe expansion slot 1.)
8. Install the screw to hold the expansion board in place.
   If the PCIe riser cage shipped without an expansion board, you may need to remove the existing screw.
9. Install the PCIe riser cage ("Install the PCI riser cage" on page 25).
   IMPORTANT: The server does not power up if the PCI riser cage is not seated properly.
10. Connect all internal or external cabling to the expansion boards, if necessary.
11. Install the access panel (on page 23).
12. Slide the server into the rack.
13. Connect each power cord to the server.
14. Connect each power cord to the power source.
15. Power up the server (on page 20).
Redundant hot-plug power supply option

⚠️ **CAUTION:** All power supplies installed in the server must have the same output power capacity. Verify that all power supplies have the same part number and label color. The system becomes unstable and may shut down when it detects mismatched power supplies.

<table>
<thead>
<tr>
<th>Label color</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>460W</td>
</tr>
<tr>
<td>Orange</td>
<td>750W</td>
</tr>
<tr>
<td>White</td>
<td>750W 48V DC</td>
</tr>
<tr>
<td>Green</td>
<td>1,200W</td>
</tr>
</tbody>
</table>

⚠️ **CAUTION:** To prevent improper cooling and thermal damage, do not operate the server unless all bays are populated with either a component or a blank.

To install the component:

1. Unfasten the cable management solution to access the power supply bays.
2. Remove the power supply blank.
3. Remove the protective cover from the connector pins on the power supply.

![Image of power supply]

**WARNING:** To reduce the risk of electric shock or damage to the equipment, do not connect the power cord to the power supply until the power supply is installed.

4. Install the redundant power supply into the bay until it clicks into place.

![Image of power supply installation]

Hardware options installation   63
5. Connect the power cord to the power supply.

6. Route the power cord through the cable management solution.

7. Connect the power cord to the power source.

8. Be sure that the power supply LED is green ("Rear panel LEDs and buttons" on page 11).

48V DC power supply option

One of the following optional HP input cables with pre-fastened ring tongues may be purchased from HP or an authorized reseller:

- A5S97A—1.3-m (4.27-ft) 48V DC Power Cable Kit
- A5S98A—2.5-m (8.20-ft) 48V DC Power Cable Kit

If you are not using an optional HP input cable, use an HP-approved 10 or 12 AWG green and yellow ground cable, no shorter than 150 cm (59.06 in), and 10 or 12 AWG power cables.

To install the component:

1. Remove the blank.
2. If you are not using an optional HP input cable, with the ground cable disconnected from the 48V power source, crimp the ring tongues to the power and ground cables coming from the 48V source.

   **IMPORTANT:** The power supply uses two power ring tongues and one ground ring tongue. They are not interchangeable.

3. Remove the safety cover from the terminal block on the front of the power supply.

4. Remove the screws from the terminal block.

   **IMPORTANT:** The minimum nominal thread diameter of a pillar or stud type terminal must be 3.5 mm (0.138 in); the diameter of a screw type terminal must be 4.0 mm (0.157 in).
5. Attach the ground (earthed) wire to the ground screw and washer and tighten to 1.47 N·m (13 lb-in) of torque. The ground wire must be connected before the positive or negative lead wires.
6. Attach the power ring tongues to the terminal block, following the polarity label below the terminal block, and then tighten the screws to 1.47 N m (13 lb-in) of torque.

7. Replace the safety cover.
8. Insert the power supply into the power supply bay until it clicks into place.

![Power supply installation image]

9. Route the power cord. Use best practices when routing power cords and other cables. A cable management arm is available to help with routing. To obtain a cable management arm, contact an HP authorized reseller.

10. Make sure the 48V DC power source is off or the PDU breaker is in the off position, and then connect the power cord to the 48V DC power source or PDU.

11. Turn on the 48V power source or switch the PDU breaker to the on position to supply 48V to the power supply.

12. Be sure that the green power supply LED is on.

**Rack bezel option**

Install the 1U rack bezel into the chassis, and then lock the 1U rack bezel with the key.

![Rack bezel installation image]
Hardware options installation

HP Trusted Platform Module option

For more information about product features, specifications, options, configurations, and compatibility, see the product QuickSpecs on the HP Product Bulletin website (http://www.hp.com/go/productbulletin).

Use these instructions to install and enable a TPM on a supported server. This procedure includes three sections:

1. Installing the Trusted Platform Module board (on page 69).
2. Retaining the recovery key/password (on page 71).

Enabling the TPM requires accessing RBSU ("HP ROM-Based Setup Utility" on page 83). For more information about RBSU, see the HP website (http://www.hp.com/go/ilomgmtengine/docs).

TPM installation requires the use of drive encryption technology, such as the Microsoft Windows BitLocker Drive Encryption feature. For more information on BitLocker, see the Microsoft website (http://www.microsoft.com).

⚠️ CAUTION: Always observe the guidelines in this document. Failure to follow these guidelines can cause hardware damage or halt data access.

When installing or replacing a TPM, observe the following guidelines:

- Do not remove an installed TPM. Once installed, the TPM becomes a permanent part of the system board.
- When installing or replacing hardware, HP service providers cannot enable the TPM or the encryption technology. For security reasons, only the customer can enable these features.
- When returning a system board for service replacement, do not remove the TPM from the system board. When requested, HP Service provides a TPM with the spare system board.
- Any attempt to remove an installed TPM from the system board breaks or disfigures the TPM security rivet. Upon locating a broken or disfigured rivet on an installed TPM, administrators should consider the system compromised and take appropriate measures to ensure the integrity of the system data.
- When using BitLocker, always retain the recovery key/password. The recovery key/password is required to enter Recovery Mode after BitLocker detects a possible compromise of system integrity.
- HP is not liable for blocked data access caused by improper TPM use. For operating instructions, see the encryption technology feature documentation provided by the operating system.

Installing the Trusted Platform Module board

⚠️ WARNING: To reduce the risk of personal injury, electric shock, or damage to the equipment, remove the power cord to remove power from the server. The front panel Power On/Standby button does not completely shut off system power. Portions of the power supply and some internal circuitry remain active until AC power is removed.

⚠️ WARNING: To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

1. Power down the server (on page 20).
2. Remove all power:
a. Disconnect each power cord from the power source.
b. Disconnect each power cord from the server.

3. Remove the server from the rack, if necessary ("Remove the server from the rack" on page 21).

4. Place the server on a flat, level work surface.

5. Remove the access panel (on page 23).

6. Remove the PCI riser cage (on page 24).

**CAUTION:** Any attempt to remove an installed TPM from the system board breaks or disfigures the TPM security rivet. Upon locating a broken or disfigured rivet on an installed TPM, administrators should consider the system compromised and take appropriate measures to ensure the integrity of the system data.

7. Install the TPM board. Press down on the connector to seat the board ("System board components" on page 12).

8. Install the TPM security rivet by pressing the rivet firmly into the system board.

9. Install the PCI riser cage (on page 25).

10. Install the access panel (on page 23).
11. Install the server into the rack ("Installing the server into the rack" on page 31).
12. Connect each power cord to the server.
13. Connect each power cord to the power source.
14. Power up the server (on page 20).

Retaining the recovery key/password

The recovery key/password is generated during BitLocker™ setup, and can be saved and printed after BitLocker™ is enabled. When using BitLocker™, always retain the recovery key/password. The recovery key/password is required to enter Recovery Mode after BitLocker™ detects a possible compromise of system integrity.

To help ensure maximum security, observe the following guidelines when retaining the recovery key/password:

- Always store the recovery key/password in multiple locations.
- Always store copies of the recovery key/password away from the server.
- Do not save the recovery key/password on the encrypted hard drive.

Enabling the Trusted Platform Module

1. When prompted during the start-up sequence, access RBSU by pressing the F9 key.
2. From the Main Menu, select Server Security.
4. From the Trusted Platform Module Menu, select TPM Functionality.
5. Select Enable, and then press the Enter key to modify the TPM Functionality setting.
6. Press the Esc key to exit the current menu, or press the F10 key to exit RBSU.
7. Reboot the server.
8. Enable the TPM in the OS. For OS-specific instructions, see the OS documentation.

⚠️ CAUTION: When a TPM is installed and enabled on the server, data access is locked if you fail to follow the proper procedures for updating the system or option firmware, replacing the system board, replacing a hard drive, or modifying OS application TPM settings.

For more information on firmware updates and hardware procedures, see the HP Trusted Platform Module Best Practices White Paper on the HP website (http://www.hp.com/support).

For more information on adjusting TPM usage in BitLocker™, see the Microsoft website (http://technet.microsoft.com/en-us/library/cc732774.aspx).
Cabling overview

This section provides guidelines that help you make informed decisions about cabling the server and hardware options to optimize performance.

For information on cabling peripheral components, refer to the white paper on high-density deployment at the HP website (http://www.hp.com/products/servers/platforms).

⚠️ **CAUTION:** When routing cables, always be sure that the cables are not in a position where they can be pinched or crimped.

Hard drive backplane cabling

The server ships with one hard drive backplane that supports up to 10 hard drives.

The server may look different than the one shown in the following illustrations, depending on the server model.

- SFF
DVD-ROM and DVD-RW drive cabling

The server may look different than the one shown in the following illustration, depending on the server model.

Chipset SATA cable option

With the chipset SATA cable option, the chipset SATA controller can be used with a single SATA hard drive that is installed in one hard drive bay of the SFF or LFF hard drive cage.

- When using the chipset SATA configuration, the following conditions apply:
  - The 10 SFF drive configuration does not support the chipset SATA option.
  - Only drive bay 1 is enabled. The remaining drive bays are disabled.
- The optical bay is disabled because the chipset SATA controller port on the system board is redirected from the optical bay to the drive cage.
- Hard drive status LEDs are not supported.
- Hard drive thermal status monitoring is not supported.
- Hot-plug operation is not supported.

- Because only one drive bay is enabled, all remaining drives can be removed.

For proper thermal cooling, install blanks in all bays that do not have a drive installed. Order a sufficient number of 6.35-cm (2.5-in) or 8.89-cm (3.5-in) hard drive blank option kits from an HP authorized reseller. For more information, see the server maintenance and service guide.

The standard SATA driver is included with supported operating systems. No additional driver is required.

⚠️ **WARNING:** Eliminate the risk of electric shock by removing all AC power from the system before installing or replacing any non-hot-plug hardware option. Disconnect all power cords to completely remove power from the server.

⚠️ **WARNING:** To reduce the risk of personal injury from hot surfaces, allow the drives and the internal system components to cool before touching them.

To install the component:

1. Power down the server (on page 20).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Extend the server from the rack (on page 20).
4. Remove the access panel (on page 23).
5. Disconnect any SAS cables from the hard drive cage and either the embedded SAS controller or an optional SAS controller. Do not disconnect the power cable.

Remove two SAS cables from an SFF configuration, or one cable from an LFF configuration.
6. Disconnect the SATA cable from the optical drive and the SATA connector on the system board. The optical bay is disabled with the chipset SATA cable option.

7. Connect the chipset SATA cable:
   a. Connect the chipset SATA cable connector to the chipset SATA controller port on the system board. The chipset SATA connector on the SATA cable is narrower than the chipset SATA controller port header on the system board.
b. Connect the remaining chipset SATA cable connector to the SATA header on the hard drive cage.

8. Clip the cable to the power supply air baffle when routing it along the edge of the system board.

9. Coil the cables behind the hard drive backplane to minimize airflow impact.

10. Install the access panel (on page 23).

11. Install the server into the rack ("Installing the server into the rack" on page 31).

12. Remove any installed hard drives.

13. Install a SATA hard drive in hard drive bay 1 ("Lockstep Memory population guidelines" on page 49, "Installing a hot-plug hard drive" on page 51).

15. Connect each power cord to the server.

16. Connect each power cord to the power source.

17. Power up the server (on page 20).
18. Using the HP ROM-Based Setup Utility (on page 83), disable the embedded P420i SAS storage controller, if necessary.

FBWC capacitor pack cabling

The second (left) capacitor pack cable connects to an optional Smart Array expansion board.
Software and configuration utilities

Server mode

The software and configuration utilities presented in this section operate in online mode, offline mode, or in both modes.

HP product QuickSpecs

For more information about product features, specifications, options, configurations, and compatibility, see the product QuickSpecs on the HP Product Bulletin website (http://www.hp.com/go/productbulletin).

HP iLO Management Engine

The HP iLO Management Engine is a set of embedded management features supporting the complete lifecycle of the server, from initial deployment through ongoing management.

HP iLO

The HP iLO subsystem is a standard component of selected HP ProLiant servers that simplifies initial server setup, server health monitoring, power and thermal optimization, and remote server administration. The HP iLO subsystem includes an intelligent microprocessor, secure memory, and a dedicated network interface. This design makes HP iLO independent of the host server and its operating system.
HP iLO enables and manages the Active Health System (on page 79) and also features Agentless Management. All key internal subsystems are monitored by HP iLO. SNMP alerts are sent directly by HP iLO regardless of the host operating system or even if no host operating system is installed.

HP Insight Remote Support software is also available in HP iLO with no operating system software, drivers, or agents.

Using HP iLO, you can do the following:

- Access a high-performance and secure Remote Console to the server from anywhere in the world.
- Use the shared HP iLO Remote Console to collaborate with up to six server administrators.
- Remotely mount high-performance Virtual Media devices to the server.
- Securely and remotely control the power state of the managed server.
- Have true Agentless Management with SNMP alerts from HP iLO regardless of the state of the host server.
- Access Active Health System troubleshooting features through the HP iLO interface.
- Subscribe to HP Insight Remote Support software without installing any drivers or agents.

For more information about HP iLO features (which may require an iLO Advanced Pack or iLO Advanced for BladeSystem license), see the HP iLO documentation on the Documentation CD or on the HP website (http://www.hp.com/go/ilo/docs).

**Active Health System**

HP Active Health System provides the following features:

- Combined diagnostics tools/scanners
- Always on, continuous monitoring for increased stability and shorter downtimes
- Rich configuration history
- Health and service alerts
- Easy export and upload to Service and Support

The HP Active Health System monitors and records changes in the server hardware and system configuration. The Active Health System assists in diagnosing problems and delivering rapid resolution when server failures occur.

The Active Health System collects the following types of data:

- Server model
- Serial number
- Processor model and speed
- Storage capacity and speed
- Memory capacity and speed
- Firmware/BIOS

HP Active Health System does not collect information about Active Health System users' operations, finances, customers, employees, partners, or data center, such as IP addresses, host names, user names, and passwords. HP Active Health System does not parse or change operating system data from third-party error event log activities, such as content created or passed through by the operating system.
The data that is collected is managed according to the HP Data Privacy policy. For more information see the HP website (http://www.hp.com/go/privacy).

The Active Health System log, in conjunction with the system monitoring provided by Agentless Management or SNMP Pass-thru, provides continuous monitoring of hardware and configuration changes, system status, and service alerts for various server components.

The Agentless Management Service is available in the SPP, which is a disk image (.iso) that you can download from the HP website (http://www.hp.com/go/spp/download). The Active Health System log can be downloaded manually from HP iLO or HP Intelligent Provisioning and sent to HP. For more information, see the HP iLO User Guide or HP Intelligent Provisioning User Guide on the HP website (http://www.hp.com/go/ilo/docs).

### Integrated Management Log

The IML records hundreds of events and stores them in an easy-to-view form. The IML timestamps each event with 1-minute granularity.

You can view recorded events in the IML in several ways, including the following:

- From within HP SIM
- From within operating system-specific IML viewers
  - For Windows: IML Viewer
  - For Linux: IML Viewer Application
- From within the HP iLO user interface
- From within HP Insight Diagnostics (on page 81)

### Intelligent Provisioning

Several packaging changes have taken place with HP ProLiant Gen8 servers: SmartStart CDs and the Smart Update Firmware DVD will no longer ship with these new servers. Instead, the deployment capability is embedded in the server as part of HP iLO Management Engine’s Intelligent Provisioning.

Intelligent Provisioning is an essential single-server deployment tool embedded in HP ProLiant Gen8 servers that simplifies HP ProLiant server setup, providing a reliable and consistent way to deploy HP ProLiant server configurations.

- Intelligent Provisioning assists with the OS installation process by preparing the system for installing “off-the-shelf” versions of leading operating system software and automatically integrating optimized HP ProLiant server support software from SPP. SPP is the installation package for operating system-specific bundles of HP ProLiant optimized drivers, utilities, management agents, and system firmware.
- Intelligent Provisioning provides maintenance-related tasks through Perform Maintenance features.
- Intelligent Provisioning provides installation help for Microsoft Windows, Red Hat and SUSE Linux, and VMware. For specific OS support, see the HP Intelligent Provisioning Release Notes on the HP website (http://www.hp.com/go/intelligentprovisioning/docs).

For more information about Intelligent Provisioning software, see the HP website (http://www.hp.com/go/intelligentprovisioning). For more information about Intelligent Provisioning drivers, firmware, and SPP, see the HP website (http://www.hp.com/go/spp/download).
**HP Insight Diagnostics**

HP Insight Diagnostics is a proactive server management tool, available in both offline and online versions, that provides diagnostics and troubleshooting capabilities to assist IT administrators who verify server installations, troubleshoot problems, and perform repair validation.

HP Insight Diagnostics Offline Edition performs various in-depth system and component testing while the OS is not running. To run this utility, boot the server using Intelligent Provisioning (on page 80).

HP Insight Diagnostics Online Edition is a web-based application that captures system configuration and other related data needed for effective server management. Available in Microsoft Windows and Linux versions, the utility helps to ensure proper system operation.

For more information or to download the utility, see the HP website (http://www.hp.com/servers/diags). HP Insight Diagnostics Online Edition is also available in the SPP. For more information, see the HP website (http://www.hp.com/go/spp/download).

**HP Insight Diagnostics survey functionality**

HP Insight Diagnostics (on page 81) provides survey functionality that gathers critical hardware and software information on ProLiant servers.

This functionality supports operating systems that are supported by the server. For operating systems supported by the server, see the HP website (http://www.hp.com/go/supportos).

If a significant change occurs between data-gathering intervals, the survey function marks the previous information and overwrites the survey data files to reflect the latest changes in the configuration.

Survey functionality is installed with every Intelligent Provisioning-assisted HP Insight Diagnostics installation, or it can be installed through the SPP (“HP Service Pack for ProLiant” on page 82).

**Erase Utility**

⚠️ **CAUTION:** Perform a backup before running the System Erase Utility. The utility sets the system to its original factory state, deletes the current hardware configuration information, including array setup and disk partitioning, and erases all connected hard drives completely. Refer to the instructions for using this utility.

Use the Erase Utility to erase hard drives and Active Health System logs, and to reset RBSU settings. Run the Erase Utility if you must erase the system for the following reasons:

- You want to install a new operating system on a server with an existing operating system.
- You encounter an error when completing the steps of a factory-installed operating system installation.

To access the Erase Utility, click the Perform Maintenance icon from the Intelligent Provisioning home screen, and then select **Erase**.

Run the Erase utility to:

- **Do not erase** — does not erase hard drive operations.
- **Reset** — erases the master boot record for the hard drives so they are no longer bootable.
- **Secure erase** — performs an overwrite pattern erase so no data is recoverable.

After selecting the appropriate option, click **Erase Selected**. A Confirm Erase window is displayed, prompting you to confirm or cancel the Erase.
HP Insight Remote Support software

HP strongly recommends that you install HP Insight Remote Support software to complete the installation or upgrade of your product and to enable enhanced delivery of your HP Warranty, HP Care Pack Service, or HP contractual support agreement. HP Insight Remote Support supplements your monitoring continuously to ensure maximum system availability by providing intelligent event diagnosis, and automatic, secure submission of hardware event notifications to HP, which will initiate a fast and accurate resolution, based on your product’s service level. Notifications may be sent to your authorized HP Channel Partner for onsite service, if configured and available in your country.

For more information, see the HP website (http://www.hp.com/go/insightremotesupport). The HP Insight Remote Support Release Notes detail the prerequisites, supported hardware, and associated operating systems. The release notes are available on the HP website (http://www.hp.com/go/insightremotesupport/docs). HP Insight Remote Support is included as part of HP Warranty, HP Care Pack Service, or HP contractual support agreement.

Scripting Toolkit

The Scripting Toolkit is a server deployment product that enables you to build an unattended automated installation for high-volume server deployments. The Scripting Toolkit is designed to support ProLiant BL, ML, DL, and SL servers. The toolkit includes a modular set of utilities and important documentation that describes how to apply these tools to build an automated server deployment process.

The Scripting Toolkit provides a flexible way to create standard server configuration scripts. These scripts are used to automate many of the manual steps in the server configuration process. This automated server configuration process cuts time from each deployment, making it possible to scale rapid, high-volume server deployments.

For more information, and to download the Scripting Toolkit, see the HP website (http://www.hp.com/go/ProLiantSTK).

HP Service Pack for ProLiant

SPP is a release set that contains a comprehensive collection of firmware and system software components, all tested together as a single solution stack for HP ProLiant servers, their options, BladeSystem enclosures, and limited HP external storage.

SPP has several key features for updating HP ProLiant servers. Using HP SUM as the deployment tool, SPP can be used in an online mode on a Windows or Linux hosted operating system, or in an offline mode where the server is booted to the ISO so that the server can be updated automatically with no user interaction or updated in interactive mode.

For more information or to download SPP, see the HP website (http://www.hp.com/go/spp).

HP Smart Update Manager

HP SUM is included in many HP products for installing and updating firmware and software on HP ProLiant servers. HP SUM provides a GUI and a command-line scriptable interface for deployment of firmware and software for single or one-to-many HP ProLiant servers and network-based targets, such as iLOs, OAs, and VC Ethernet and Fibre Channel modules.

Key features of HP SUM include:
• Dependency checking, which ensures appropriate installation order and dependency checking between components
• Intelligent deployment of only required updates
• Simultaneous firmware and software deployment for multiple remote targets in both GUI and CLI modes
• Improved deployment performance
• Local online deployment of HP ProLiant servers and enclosures
• Remote (one-to-many) online deployment of HP ProLiant servers and enclosures
• Local offline firmware deployments with HP Support Pack for ProLiant deliverables
• Remote offline deployment when used with the Scripting Toolkit (HP ProLiant Gen8 and later), iLO Virtual Media, or PXE booted media
• GUI or CLI scripts with extensive logging
• Remote command-line deployment
• Support for updating firmware on network-based targets such as the OA, iLO through the Network Management Port, VC Ethernet and Fibre Channel modules, and 3Gb/6Gb SAS BL Switch interconnects on HP ProLiant servers

For more information about HP SUM and to access the HP Smart Update Manager User Guide, see the HP website (http://www.hp.com/go/hpsum/documentation).

HP ROM-Based Setup Utility

RBSU is a configuration utility embedded in HP ProLiant servers that performs a wide range of configuration activities that can include the following:
• Configuring system devices and installed options
• Enabling and disabling system features
• Displaying system information
• Selecting the primary boot controller
• Configuring memory options
• Language selection

For more information on RBSU, see the HP ROM-Based Setup Utility User Guide on the Documentation CD or the HP website (http://www.hp.com/support/rbsu).

Using RBSU

To use RBSU, use the following keys:
• To access RBSU, press the F9 key during power-up when prompted.
• To navigate the menu system, use the arrow keys.
• To make selections, press the Enter key.
• To access Help for a highlighted configuration option, press the F1 key.
**IMPORTANT:** RBSU automatically saves settings when you press the **Enter** key. The utility does not prompt you for confirmation of settings before you exit the utility. To change a selected setting, you must select a different setting and press the **Enter** key.

Default configuration settings are applied to the server at one of the following times:
- Upon the first system power-up
- After defaults have been restored

Default configuration settings are sufficient for proper typical server operation, but configuration settings can be modified using RBSU. The system will prompt you for access to RBSU with each power-up.

### Auto-configuration process

The auto-configuration process automatically runs when you boot the server for the first time. During the power-up sequence, the system ROM automatically configures the entire system without needing any intervention. During this process, the ORCA utility, in most cases, automatically configures the array to a default setting based on the number of drives connected to the server.

**NOTE:** If the boot drive is not empty or has been written to in the past, ORCA does not automatically configure the array. You must run ORCA to configure the array settings.

**NOTE:** The server may not support all the following examples.

<table>
<thead>
<tr>
<th>Drives installed</th>
<th>Drives used</th>
<th>RAID level</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>RAID 0</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>RAID 1</td>
</tr>
<tr>
<td>3, 4, 5, or 6</td>
<td>3, 4, 5, or 6</td>
<td>RAID 5</td>
</tr>
<tr>
<td>More than 6</td>
<td>0</td>
<td>None</td>
</tr>
</tbody>
</table>

To change any ORCA default settings and override the auto-configuration process, press the **F8** key when prompted.

For more information on RBSU, see the *HP ROM-Based Setup Utility User Guide* on the Documentation CD or the HP website ([http://www.hp.com/support/rbsu](http://www.hp.com/support/rbsu)).

### Boot options

Near the end of the boot process, the boot options screen is displayed. This screen is visible for several seconds before the system attempts to boot from a supported boot device. During this time, you can do the following:
- Access RBSU by pressing the **F9** key.
- Access Intelligent Provisioning Maintenance Menu by pressing the **F10** key.
- Access the boot menu by pressing the **F11** key.
- Force a PXE Network boot by pressing the **F12** key.
Configuring AMP modes

Not all HP ProLiant servers support all AMP modes. RBSU provides menu options only for the modes supported by the server. Advanced memory protection within RBSU enables the following advanced memory modes:

- Advanced ECC Mode—Provides memory protection beyond Standard ECC. All single-bit failures and some multi-bit failures can be corrected without resulting in system downtime.
- Online Spare Mode—Provides protection against failing or degraded DIMMs. Certain memory is set aside as spare, and automatic failover to spare memory occurs when the system detects a degraded DIMM. DIMMs that are likely to receive a fatal or uncorrectable memory error are removed from operation automatically, resulting in less system downtime.

For DIMM population requirements, see the server-specific user guide.

Re-entering the server serial number and product ID

After you replace the system board, you must re-enter the server serial number and the product ID.

1. During the server startup sequence, press the F9 key to access RBSU.
2. Select the Advanced Options menu.
3. Select Service Options.
4. Select Serial Number. The following warning appears:
   Warning: The serial number should ONLY be modified by qualified service personnel. This value should always match the serial number located on the chassis.
5. Press the Enter key to clear the warning.
6. Enter the serial number and press the Enter key.
7. Select Product ID. The following warning appears:
   Warning: The Product ID should ONLY be modified by qualified service personnel. This value should always match the Product ID located on the chassis.
8. Enter the product ID and press the Enter key.
9. Press the Esc key to close the menu.
10. Press the Esc key to exit RBSU.
11. Press the F10 key to confirm exiting RBSU. The server automatically reboots.

Utilities and features

Array Configuration Utility

ACU is a utility with the following features:

- Runs as a local application or remote service accessed through the HP System Management Homepage
- Supports online array capacity expansion, logical drive extension, assignment of online spares, and RAID or stripe size migration
- Suggests the optimum configuration for an unconfigured system
• For supported controllers, provides access to licensed features, including:
  o Moving and deleting individual logical volumes
  o Advanced Capacity Expansion (SATA to SAS and SAS to SATA)
  o Offline Split Mirror
  o RAID 6 and RAID 60
  o RAID 1 (ADM) and RAID 10 (ADM)
  o HP Drive Erase
  o Video-On-Demand Advanced Controller Settings
• Provides different operating modes, enabling faster configuration or greater control over the configuration options
• Remains available any time that the server is on
• Displays on-screen tips for individual steps of a configuration procedure
• Provides context-sensitive searchable help content
• Provides diagnostic and SmartSSD Wear Gauge functionality on the Diagnostics tab

ACU is now available as an embedded utility, starting with HP ProLiant Gen8 servers. To access ACU, use one of the following methods:
• If an optional controller is not installed, press **F10** during boot.
• If an optional controller is installed, when the system recognizes the controller during POST, press **F5**.

For optimum performance, the minimum display settings are 1024 × 768 resolution and 16-bit color. Servers running Microsoft® operating systems require one of the following supported browsers:
• Internet Explorer 6.0 or later
• Mozilla Firefox 2.0 or later

For Linux servers, see the README.TXT file for additional browser and support information.

For more information about the controller and its features, see the *HP Smart Array Controllers for HP ProLiant Servers User Guide* on the HP website (http://www.hp.com/support/SAC_UG_ProLiantServers_en). To configure arrays, see the *Configuring Arrays on HP Smart Array Controllers Reference Guide* on the HP website (http://www.hp.com/support/CASAC_RG_en).

**HP Smart Storage Administrator**

HP SSA is a configuration and management tool for HP Smart Array controllers. Starting with HP ProLiant Gen8 servers, HP SSA replaces ACU with an enhanced GUI and additional configuration features.

HP SSA exists in three interface formats: the HP SSA GUI, the HP SSA CLI, and HP SSA Scripting. Although all formats provide support for configuration tasks, some of the advanced tasks are available in only one format.

Some HP SSA features include the following:
• Supports online array capacity expansion, logical drive extension, assignment of online spares, and RAID or stripe size migration
• Suggests the optimal configuration for an unconfigured system
• Provides diagnostic and SmartSSD Wear Gauge functionality on the Diagnostics tab
Option ROM Configuration for Arrays

Before installing an operating system, you can use the ORCA utility to create the first logical drive, assign RAID levels, and establish online spare configurations.

The utility also provides support for the following functions:

- Reconfiguring one or more logical drives
- Viewing the current logical drive configuration
- Deleting a logical drive configuration
- Setting the controller to be the boot controller
- Selecting the boot volume

If you do not use the utility, ORCA will default to the standard configuration.

For more information regarding the default configurations that ORCA uses, see the HP ROM-Based Setup Utility User Guide on the Documentation CD or the HP website (http://www.hp.com/support/rbsu).

For more information about the controller and its features, see the HP Smart Array Controllers for HP ProLiant Servers User Guide on the HP website (http://www.hp.com/support/SAC_UG_ProLiantServers_en). To configure arrays, see the Configuring Arrays on HP Smart Array Controllers Reference Guide on the HP website (http://www.hp.com/support/CASAC_RG_en).

ROMPaq utility

The ROMPaq utility enables you to upgrade the system firmware (BIOS). To upgrade the firmware, insert a ROMPaq USB Key into an available USB port and boot the system. In addition to ROMPaq, Online Flash Components for Windows and Linux operating systems are available for updating the system firmware.

The ROMPaq utility checks the system and provides a choice (if more than one exists) of available firmware revisions.

For more information, go to the HP website (http://www.hp.com/go/hpsc) and click on Drivers, Software & Firmware. Then, enter your product name in the Find an HP product field and click Go.

Automatic Server Recovery

ASR is a feature that causes the system to restart when a catastrophic operating system error occurs, such as a blue screen, ABEND (does not apply to HP ProLiant DL980 Servers), or panic. A system fail-safe timer, the ASR timer, starts when the System Management driver, also known as the Health Driver, is loaded. When the operating system is functioning properly, the system periodically resets the timer. However, when the operating system fails, the timer expires and restarts the server.

ASR increases server availability by restarting the server within a specified time after a system hang. At the same time, the HP SIM console notifies you by sending a message to a designated pager number that ASR has restarted the system. You can disable ASR from the System Management Homepage or through RBSU.
USB support

HP provides both standard USB 2.0 support and legacy USB 2.0 support. Standard support is provided by the OS through the appropriate USB device drivers. Before the OS loads, HP provides support for USB devices through legacy USB support, which is enabled by default in the system ROM.

Legacy USB support provides USB functionality in environments where USB support is not available normally. Specifically, HP provides legacy USB functionality for the following:

- POST
- RBSU
- Diagnostics
- DOS
- Operating environments which do not provide native USB support

Redundant ROM support

The server enables you to upgrade or configure the ROM safely with redundant ROM support. The server has a single ROM that acts as two separate ROM images. In the standard implementation, one side of the ROM contains the current ROM program version, while the other side of the ROM contains a backup version.

NOTE: The server ships with the same version programmed on each side of the ROM.

Safety and security benefits

When you flash the system ROM, ROMPaq writes over the backup ROM and saves the current ROM as a backup, enabling you to switch easily to the alternate ROM version if the new ROM becomes corrupted for any reason. This feature protects the existing ROM version, even if you experience a power failure while flashing the ROM.

Keeping the system current

Drivers

IMPORTANT: Always perform a backup before installing or updating device drivers.

The server includes new hardware that may not have driver support on all OS installation media.

If you are installing an Intelligent Provisioning-supported OS, use Intelligent Provisioning (on page 80) and its Configure and Install feature to install the OS and latest supported drivers.

If you do not use Intelligent Provisioning to install an OS, drivers for some of the new hardware are required. These drivers, as well as other option drivers, ROM images, and value-add software can be downloaded as part of an SPP.

If you are installing drivers from SPP, be sure that you are using the latest SPP version that your server supports. To verify that your server is using the latest supported version and for more information about SPP, see the HP website (http://www.hp.com/go/spp/download).
To locate the drivers for a particular server, go to the HP website (http://www.hp.com/go/hpsc) and click on Drivers, Software & Firmware. Then, enter your product name in the Find an HP product field and click Go.

Software and firmware

Software and firmware should be updated before using the server for the first time, unless any installed software or components require an older version. For system software and firmware updates, download the SPP ("HP Service Pack for ProLiant" on page 82) from the HP website (http://www.hp.com/go/spp).

Version control

The VCRM and VCA are web-enabled Insight Management Agents tools that HP SIM uses to schedule software update tasks to the entire enterprise.

- VCRM manages the repository for SPP. Administrators can view the SPP contents or configure VCRM to automatically update the repository with internet downloads of the latest software and firmware from HP.
- VCA compares installed software versions on the node with updates available in the VCRM managed repository. Administrators configure VCA to point to a repository managed by VCRM.

HP operating systems and virtualization software support for ProLiant servers

For information about specific versions of a supported operating system, see the HP website (http://www.hp.com/go/ossupport).

HP Technology Service Portfolio

HP Technology Services offers a targeted set of consultancy, deployment, and service solutions to meet the support needs of most business and IT environments.

Foundation Care services—Delivers scalable hardware and software support packages for HP ProLiant server and industry-standard software. You can choose the type and level of service that is most suitable for your business needs.

HP Collaborative Support—With a single call, HP addresses initial hardware and software support needs and helps to quickly identify if a problem is related to hardware or software. If the problem is related to hardware, HP resolves the problem according to service level commitments. If the reported incident is related to an HP software product or a supported third-party software product and cannot be resolved by applying known fixes, HP contacts the third-party vendor and creates a problem incident on your behalf.

HP Proactive Care—For customers running business critical environments where downtime is not an option, HP Proactive Care helps to deliver high levels of availability. Key to these service options is the delivery of proactive service management tools to help you avoid the causes of downtime. If a problem arises, then HP offers advanced technical response from critical system support specialists for problem identification and resolution.
HP Support Center—For all service options, the HP Support Center delivers the information, tools, and experts required to support HP business products.

HP Insight Remote Support—Provides 24x7 secure remote monitoring, diagnosis, and problem resolution.

For more information, see one of the following websites:

- HP ProLiant Server Services website (http://www.hp.com/services/proliant)
- HP BladeSystem Services website (http://www.hp.com/services/bladesystem)

Change control and proactive notification

HP offers Change Control and Proactive Notification to notify customers 30 to 60 days in advance of upcoming hardware and software changes on HP commercial products.

For more information, refer to the HP website (http://www.hp.com/go/pcn).
Troubleshooting

Troubleshooting resources

The *HP ProLiant Gen8 Troubleshooting Guide, Volume I: Troubleshooting* provides procedures for resolving common problems and comprehensive courses of action for fault isolation and identification, issue resolution, and software maintenance on ProLiant servers and server blades. To view the guide, select a language:

- English ([http://www.hp.com/support/ProLiant_TSG_v1_en](http://www.hp.com/support/ProLiant_TSG_v1_en))
- French ([http://www.hp.com/support/ProLiant_TSG_v1_fr](http://www.hp.com/support/ProLiant_TSG_v1_fr))
- Spanish ([http://www.hp.com/support/ProLiant_TSG_v1_sp](http://www.hp.com/support/ProLiant_TSG_v1_sp))
- German ([http://www.hp.com/support/ProLiant_TSG_v1_gr](http://www.hp.com/support/ProLiant_TSG_v1_gr))
- Japanese ([http://www.hp.com/support/ProLiant_TSG_v1_jp](http://www.hp.com/support/ProLiant_TSG_v1_jp))
- Simplified Chinese ([http://www.hp.com/support/ProLiant_TSG_v1_sc](http://www.hp.com/support/ProLiant_TSG_v1_sc))

The *HP ProLiant Gen8 Troubleshooting Guide, Volume II: Error Messages* provides a list of error messages and information to assist with interpreting and resolving error messages on ProLiant servers and server blades. To view the guide, select a language:

- English ([http://www.hp.com/support/ProLiant_EMG_v1_en](http://www.hp.com/support/ProLiant_EMG_v1_en))
- French ([http://www.hp.com/support/ProLiant_EMG_v1_fr](http://www.hp.com/support/ProLiant_EMG_v1_fr))
- Spanish ([http://www.hp.com/support/ProLiant_EMG_v1_sp](http://www.hp.com/support/ProLiant_EMG_v1_sp))

System battery

If the server no longer automatically displays the correct date and time, you may need to replace the battery that provides power to the real-time clock. Under normal use, battery life is 5 to 10 years.

**WARNING:** The computer contains an internal lithium manganese dioxide, a vanadium pentoxide, or an alkaline battery pack. A risk of fire and burns exists if the battery pack is not properly handled. To reduce the risk of personal injury:
- Do not attempt to recharge the battery.
- Do not expose the battery to temperatures higher than 60°C (140°F).
- Do not disassemble, crush, puncture, short external contacts, or dispose of in fire or water.
- Replace only with the spare designated for this product.

To remove the component:
1. Power down the server (on page 20).
2. Remove all power:
   a. Disconnect each power cord from the power source.
   b. Disconnect each power cord from the server.
3. Extend or remove the server from the rack ("Extend the server from the rack" on page 20, "Remove the server from the rack" on page 21).
4. Remove the access panel (on page 23).
5. If installed, remove the FBWC capacitor pack (on page 23).
6. Locate the battery on the system board ("System board components" on page 12).
7. Remove the battery.

**IMPORTANT:** Replacing the system board battery resets the system ROM to its default configuration. After replacing the battery, reconfigure the system through RBSU.
To replace the component, reverse the removal procedure.

For more information about battery replacement or proper disposal, contact an authorized reseller or an authorized service provider.

Electrostatic discharge

Preventing electrostatic discharge

To prevent damaging the system, be aware of the precautions you need to follow when setting up the system or handling parts. A discharge of static electricity from a finger or other conductor may damage system boards or other static-sensitive devices. This type of damage may reduce the life expectancy of the device.

To prevent electrostatic damage:

- Avoid hand contact by transporting and storing products in static-safe containers.
- Keep electrostatic-sensitive parts in their containers until they arrive at static-free workstations.
- Place parts on a grounded surface before removing them from their containers.
- Avoid touching pins, leads, or circuitry.
- Always be properly grounded when touching a static-sensitive component or assembly.

Grounding methods to prevent electrostatic discharge

Several methods are used for grounding. Use one or more of the following methods when handling or installing electrostatic-sensitive parts:

- Use a wrist strap connected by a ground cord to a grounded workstation or computer chassis. Wrist straps are flexible straps with a minimum of 1 megohm ±10 percent resistance in the ground cords. To provide proper ground, wear the strap snug against the skin.
- Use heel straps, toe straps, or boot straps at standing workstations. Wear the straps on both feet when standing on conductive floors or dissipating floor mats.
- Use conductive field service tools.
- Use a portable field service kit with a folding static-dissipating work mat.

If you do not have any of the suggested equipment for proper grounding, have an authorized reseller install the part.

For more information on static electricity or assistance with product installation, contact an authorized reseller.

#### CAUTION:
This equipment is designed to permit the connection of the earthed conductor of the DC supply circuit to the earthing conductor at the equipment.
If this connection is made, all of the following must be met:
- This equipment must be connected directly to the DC supply system earthing electrode conductor or to a bonding jumper from an earthing terminal bar or bus to which the DC supply system earthing electrode conductor is connected.
- This equipment must be located in the same immediate area (such as adjacent cabinets) as any other equipment that has a connection between the earthed conductor of the same DC supply circuit and the earthing conductor, and also the point of earthing of the DC system. The DC system must be earthed elsewhere.
- The DC supply source is to be located within the same premises as the equipment.
- Switching or disconnecting devices must not be in the earthed circuit conductor between the DC source and the point of connection of the earthing electrode conductor.

#### CAUTION:
To reduce the risk of electric shock or energy hazards:
- This equipment must be installed by trained service personnel, as defined by the NEC and IEC 60950-1, Second Edition, the standard for Safety of Information Technology Equipment.
- Connect the equipment to a reliably grounded SELV source. An SELV source is a secondary circuit that is designed so normal and single fault conditions do not cause the voltages to exceed a safe level (60 V DC).
- The branch circuit overcurrent protection must be rated 24 A.

Hot-plug power supply calculations

For hot-plug power supply specifications and calculators to determine electrical and heat loading for the server, see the HP Power Advisor website (http://www.hp.com/go/hppoweradvisor).
Support and other resources

Before you contact HP

Be sure to have the following information available before you call HP:

- **Active Health System log (HP ProLiant Gen8 or later products)**
  Download and have available an Active Health System log for 3 days before the failure was detected. For more information, see the [HP iLO 4 User Guide or HP Intelligent Provisioning User Guide](http://www.hp.com/go/ilo/docs) on the HP website.

- **Onboard Administrator SHOW ALL report (for HP BladeSystem products only)**
  For more information on obtaining the Onboard Administrator SHOW ALL report, see the [HP website](http://www.hp.com/go/OAlog).

- **Technical support registration number (if applicable)**

- **Product serial number**

- **Product model name and number**

- **Product identification number**

- **Applicable error messages**

- **Add-on boards or hardware**

HP contact information

For United States and worldwide contact information, see the [Contact HP website](http://www.hp.com/go/assistance).

In the United States:

- To contact HP by phone, call 1-800-334-5144. For continuous quality improvement, calls may be recorded or monitored.

- If you have purchased a Care Pack (service upgrade), see the [Support & Drivers website](http://www8.hp.com/us/en/support-drivers.html). If the problem cannot be resolved at the website, call 1-800-633-3600. For more information about Care Packs, see the HP website ([http://pro-aq-sama.houston.hp.com/services/cache/10950-0-0-225-121.html](http://pro-aq-sama.houston.hp.com/services/cache/10950-0-0-225-121.html)).

Customer Self Repair

HP products are designed with many Customer Self Repair (CSR) parts to minimize repair time and allow for greater flexibility in performing defective parts replacement. If during the diagnosis period HP (or HP service
providers or service partners) identifies that the repair can be accomplished by the use of a CSR part, HP will ship that part directly to you for replacement. There are two categories of CSR parts:

- **Mandatory**—Parts for which customer self repair is mandatory. If you request HP to replace these parts, you will be charged for the travel and labor costs of this service.

- **Optional**—Parts for which customer self repair is optional. These parts are also designed for customer self repair. If, however, you require that HP replace them for you, there may or may not be additional charges, depending on the type of warranty service designated for your product.

**NOTE:** Some HP parts are not designed for customer self repair. In order to satisfy the customer warranty, HP requires that an authorized service provider replace the part. These parts are identified as "No" in the Illustrated Parts Catalog.

Based on availability and where geography permits, CSR parts will be shipped for next business day delivery. Same day or four-hour delivery may be offered at an additional charge where geography permits. If assistance is required, you can call the HP Technical Support Center and a technician will help you over the telephone. HP specifies in the materials shipped with a replacement CSR part whether a defective part must be returned to HP. In cases where it is required to return the defective part to HP, you must ship the defective part back to HP within a defined period of time, normally five (5) business days. The defective part must be returned with the associated documentation in the provided shipping material. Failure to return the defective part may result in HP billing you for the replacement. With a customer self repair, HP will pay all shipping and part return costs and determine the courier/carrier to be used.

For more information about HP’s Customer Self Repair program, contact your local service provider. For the North American program, refer to the HP website (http://www.hp.com/go/selfrepair).

Réparation par le client (CSR)

Les produits HP comportent de nombreuses pièces CSR (Customer Self Repair = réparation par le client) afin de minimiser les délais de réparation et faciliter le remplacement des pièces défectueuses. Si pendant la période de diagnostic, HP (ou ses partenaires ou mainteneurs agréés) détermine que la réparation peut être effectuée à l’aide d’une pièce CSR, HP vous l’envoie directement. Il existe deux catégories de pièces CSR:

- **Obligatoire** - Pièces pour lesquelles la réparation par le client est obligatoire. Si vous demandez à HP de remplacer ces pièces, les coûts de déplacement et main d’œuvre du service vous seront facturés.

- **Facultatif** - Pièces pour lesquelles la réparation par le client est facultative. Ces pièces sont également conçues pour permettre au client d’effectuer lui-même la réparation. Toutefois, si vous demandez à HP de remplacer ces pièces, l’intervention peut ou non vous être facturée, selon le type de garantie applicable à votre produit.

**REMARQUE:** Certaines pièces HP ne sont pas conçues pour permettre au client d’effectuer lui-même la réparation. Pour que la garantie puisse s’appliquer, HP exige que le remplacement de la pièce soit effectué par un Mainteneur Agréé. Ces pièces sont identifiées par la mention "Non" dans le Catalogue illustré.

Les pièces CSR sont livrées le jour ouvré suivant, dans la limite des stocks disponibles et selon votre situation géographique. Si votre situation géographique le permet et que vous demandez une livraison le jour même ou dans les 4 heures, celle-ci vous sera facturée. Pour bénéficier d’une assistance téléphonique,appelez le Centre d’assistance technique HP. Dans les documents envoyés avec la pièce de rechange CSR, HP précise s’il est nécessaire de lui retourner la pièce défectueuse. Si c’est le cas, vous devez le faire dans le délai indiqué, généralement cinq (5) jours ouvrés. La pièce et sa documentation doivent être retournées dans l’emballage fourni. Si vous ne retournez pas la pièce défectueuse, HP se réserve le droit de vous facturer les coûts de remplacement. Dans le cas d’une pièce CSR, HP supporte l’ensemble des frais d’expédition et de retour, et détermine la société de courses ou le transporteur à utiliser.
Riparazione da parte del cliente

Per abbreviare i tempi di riparazione e garantire una maggiore flessibilità nella sostituzione di parti difettose, i prodotti HP sono realizzati con numerosi componenti che possono essere riparati direttamente dal cliente (CSR, Customer Self Repair). Se in fase di diagnostica HP (o un centro di servizi o di assistenza HP) identifica il guasto come riparabile mediante un ricambio CSR, HP lo spedirà direttamente al cliente per la sostituzione. Vi sono due categorie di parti CSR:

Obbligatorie – Parti che devono essere necessariamente riparate dal cliente. Se il cliente ne affida la riparazione ad HP, deve sostenere le spese di spedizione e di manodopera per il servizio.

Opzionali – Parti la cui riparazione da parte del cliente è facoltativa. Si tratta comunque di componenti progettati per questo scopo. Se tuttavia il cliente ne richiede la sostituzione ad HP, potrebbe dover sostenere spese addizionali a seconda del tipo di garanzia previsto per il prodotto.

NOTA: alcuni componenti HP non sono progettati per la riparazione da parte del cliente. Per rispettare la garanzia, HP richiede che queste parti siano sostituite da un centro di assistenza autorizzato. Tali parti sono identificate da un “No” nel Catalogo illustrato dei componenti.

In base alla disponibilità e alla località geografica, le parti CSR vengono spedite con consegna entro il giorno lavorativo seguente. La consegna nel giorno stesso o entro quattro ore è offerta con un supplemento di costo solo in alcune zone. In caso di necessità si può richiedere l’assistenza telefonica di un addetto del centro di supporto tecnico HP. Nel materiale fornito con una parte di ricambio CSR, HP specifica se il cliente deve restituire dei componenti. Qualora sia richiesta la resa ad HP del componente difettoso, lo si deve spedire ad HP entro un determinato periodo di tempo, generalmente cinque (5) giorni lavorativi. Il componente difettoso deve essere restituito con la documentazione associata nell’imballo di spedizione fornito. La mancata restituzione del componente può comportare la fatturazione del ricambio da parte di HP.

Customer Self Repair

HP Produkte enthalten viele CSR-Teile (Customer Self Repair), um Reparaturzeiten zu minimieren und höhere Flexibilität beim Austausch defekter Bauteile zu ermöglichen. Wenn HP (oder ein HP Servicepartner) bei der Diagnose feststellt, dass das Produkt mithilfe eines CSR-Teils repariert werden kann, sendet Ihnen HP dieses Bauteil zum Austausch direkt zu. CSR-Teile werden in zwei Kategorien unterteilt:

Reparaciones del propio cliente

Los productos de HP incluyen muchos componentes que el propio usuario puede reemplazar (Customer Self Repair, CSR) para minimizar el tiempo de reparación y ofrecer una mayor flexibilidad a la hora de realizar sustituciones de componentes defectuosos. Si, durante la fase de diagnóstico, HP (o los proveedores o socios de servicio de HP) identifica que una reparación puede llevarse a cabo mediante el uso de un componente CSR, HP le enviará dicho componente directamente para que realice su sustitución. Los componentes CSR se clasifican en dos categorías:

- **Obligatorio:** componentes para los que la reparación por parte del usuario es obligatoria. Si solicita a HP que realice la sustitución de estos componentes, tendrá que hacerse cargo de los gastos de desplazamiento y de mano de obra de dicho servicio.

- **Opcional:** componentes para los que la reparación por parte del usuario es opcional. Estos componentes también están diseñados para que puedan ser reparados por el usuario. Sin embargo, si precisa que HP realice su sustitución, puede o no conllevar costes adicionales, dependiendo del tipo de servicio de garantía correspondiente al producto.

NOTA: Algunos componentes no están diseñados para que puedan ser reparados por el usuario. Para que el usuario haga valer su garantía, HP pone como condición que un proveedor de servicios autorizado realice la sustitución de estos componentes. Dichos componentes se identifican con la palabra "No" en el catálogo ilustrado de componentes.

Según la disponibilidad y la situación geográfica, los componentes CSR se enviarán para que lleguen a su destino al siguiente día laborable. Si la situación geográfica lo permite, se puede solicitar la entrega en el mismo día o en cuatro horas con un coste adicional. Si precisa asistencia técnica, puede llamar al Centro de asistencia técnica de HP y recibirá ayuda telefónica por parte de un técnico. Con el envío de materiales para la sustitución de componentes CSR, HP especificará si los componentes defectuosos deberán devolverse a HP. En aquellos casos en los que sea necesario devolver algún componente a HP, deberá hacerlo en el periodo de tiempo especificado, normalmente cinco días laborables. Los componentes defectuosos deberán devolverse con toda la documentación relacionada y con el embalaje de envío. Si no envíe el componente defectuoso requerido, HP podrá cobrarle por el de sustitución. En el caso de todas
sustituciones que lleve a cabo el cliente, HP se hará cargo de todos los gastos de envío y devolución de componentes y escogerá la empresa de transporte que se utilice para dicho servicio.

Para obtener más información acerca del programa de Reparaciones del propio cliente de HP, póngase en contacto con su proveedor de servicios local. Si está interesado en el programa para Norteamérica, visite la página web de HP siguiente (http://www.hp.com/go/selfrepair).

**Customer Self Repair**

Veel onderdelen in HP producten zijn door de klant zelf te repareren, waardoor de reparatieduur tot een minimum beperkt kan blijven en de flexibiliteit in het vervangen van defecte onderdelen groter is. Deze onderdelen worden CSR-onderdelen (Customer Self Repair) genoemd. Als HP (of een HP Service Partner) bij de diagnose vaststelt dat de reparatie kan worden uitgevoerd met een CSR-onderdeel, verzendt HP dat onderdeel rechtstreeks naar u, zodat u het defecte onderdeel daarmee kunt vervangen. Er zijn twee categorieën CSR-onderdelen:

Verplicht: Onderdelen waarvoor reparatie door de klant verplicht is. Als u HP verzoekt deze onderdelen voor u te vervangen, worden u voor deze service reiskosten en arbeidsloon in rekening gebracht.

Optioneel: Onderdelen waarvoor reparatie door de klant optioneel is. Ook deze onderdelen zijn ontworpen voor reparatie door de klant. Als u echter HP verzoekt deze onderdelen voor u te vervangen, kunnen daarvoor extra kosten in rekening worden gebracht, afhankelijk van het type garantieservice voor het product.

OPMERKING: Sommige HP onderdelen zijn niet ontwikkeld voor reparatie door de klant. In verband met de garantievoorwaarden moet het onderdeel door een geautoriseerde Service Partner worden vervangen. Deze onderdelen worden in de geïllustreerde onderdelencatalogus aangemerkt met "Nee".

Afhankelijk van de leverbaarheid en de locatie worden CSR-onderdelen verzonden voor levering op de eerstvolgende werkdag. Levering op dezelfde dag of binnen vier uur kan tegen meerkosten worden aangeboden, indien dit mogelijk is gezien de locatie. Indien assistentie gewenst is, belt u een HP Service Partner om via de telefoon technische ondersteuning te ontvangen. HP vermeldt in de documentatie bij het vervangende CSR-onderdeel of het defecte onderdeel aan HP moet worden geretourneerd. Als het defecte onderdeel aan HP moet worden teruggezonden, moet u het defecte onderdeel binnen een bepaalde periode, gewoonlijk vijf (5) werkdagen, retourneren aan HP. Het defecte onderdeel moet met de bijbehorende documentatie worden geretourneerd in het meegeleverde verpakkingsmateriaal. Als u het defecte onderdeel niet terugzond, kan HP u voor het vervangende onderdeel kosten in rekening brengen. Bij reparatie door de klant betaalt HP alle verzendkosten voor het vervangende en geretourneerde onderdeel en kiest HP zelf welke koerier/transportonderneming hiervoor wordt gebruikt.

Neem contact op met een Service Partner voor meer informatie over het Customer Self Repair programma van HP. Informatie over Service Partners vindt u op de HP website (http://www.hp.com/go/selfrepair).

**Reparo feito pelo cliente**

Os produtos da HP são projetados com muitas peças para reparo feito pelo cliente (CSR) de modo a minimizar o tempo de reparo e permitir maior flexibilidade na substituição de peças com defeito. Se, durante o período de diagnóstico, a HP (ou fornecedores/parceiros de serviço da HP) concluir que o reparo pode ser efetuado pelo uso de uma peça CSR, a peça de reposição será enviada diretamente ao cliente. Existem duas categorias de peças CSR:

Obrigatória – Peças cujo reparo feito pelo cliente é obrigatório. Se desejar que a HP substitua essas peças, serão cobradas as despesas de transporte e mão-de-obra do serviço.
Opcional – Peças cujo reparo feito pelo cliente é opcional. Essas peças também são projetadas para o reparo feito pelo cliente. No entanto, se desejarmos que a HP as substitua, pode haver ou não a cobrança de taxa adicional, dependendo do tipo de serviço de garantia destinado ao produto.

**OBSERVAÇÃO:** Algumas peças da HP não são projetadas para o reparo feito pelo cliente. A fim de cumprir a garantia do cliente, a HP exige que um técnico autorizado substitua a peça. Essas peças estão identificadas com a marca "No" (Não), no catálogo de peças ilustrado.

Conforme a disponibilidade e o local geográfico, as peças CSR serão enviadas no primeiro dia útil após o pedido. Onde as condições geográficas permitirem, a entrega no mesmo dia ou em quatro horas pode ser feita mediante uma taxa adicional. Se precisar de auxílio, entre em contato com o Centro de suporte técnico da HP para que um técnico o ajude por telefone. A HP especifica nos materiais fornecidos com a peça CSR de reposição se a peça com defeito deve ser devolvida à HP. Nos casos em que isso for necessário, é preciso enviar a peça com defeito à HP dentro do período determinado, normalmente cinco (5) dias úteis.

A peça com defeito deve ser enviada com a documentação correspondente no material de transporte fornecido. Caso não o faça, a HP poderá cobrar a reposição. Para as peças de reparo feito pelo cliente, a HP paga todas as despesas de transporte e de devolução da peça e determina a transportadora/serviço postal a ser utilizado.

---

**カスタマーセルフリペア**

修理時間を短縮し、故障部品の交換における高い柔軟性を確保するために、HP製品には多数のCSR部品があります。診断の際に、CSR部品を使用すれば修理ができるとHP（HPまたはHP正規保守代理店）が判断した場合、HPはその部品を直接、お客様に発送し、お客様に交換していただきます。CSR部品には以下の2通りがあります。

- **必須・カスタマーセルフリペア** が必須の部品。当該部品について、もしもお客様がHPに交換作業を依頼される場合、もう1つは修理サービスに関する交通費および工件費がお客様に請求されます。

- **任意・カスタマーセルフリペア**が任意である部品。この部品もカスタマーセルフリペア用です。当該部品について、もしもお客様がHPに交換作業を依頼される場合には、買い上げの製品に適用される保証サービス内容の範囲内において、別途費用を負担していただくことなく保証サービスを受けることができます。

注：HP製品の一部の部品は、カスタマーセルフリペア用ではありません。製品の保証を継続するためには、HPまたはHP正規保守代理店による交換作業が必要となります。CSRカタログには、当該部品がカスタマーセルフリペア除外品である旨が記載されています。

部品供給が可能な場合、地域によっては、CSR部品を翌営業日に届くように発送します。また、地域によっては、追加費用を負担いただくことにより同日または4時間以内に届くように発送することも可能な場合があります。サポートが必要なときは、HPの修理受付窓口に電話していただければ、技術者が電話でアドバイスします。交換用のCSR部品または同様物には、故障部品をHPに返送する必要があるかどうかが表示されています。故障部品をHPに返送する必要がある場合は、指定期間内（通常は5営業日以内）に故障部品をHPに返送してください。故障部品を返送する場合は、届いた時の梱包箱に関連書類ともに入れてください。故障部品を返送しない場合、HP側で部品費用が請求されます。カスタマーセルフリペアの際には、HPは送料および部品返送費用を全額負担し、使用する宅配便会社や運送会社を指定します。

Support and other resources  107
客戶自行維修

HP 產品提供許多客戶自行維修 (CSR) 部件，以盡可能縮短維修时间和在更換缺陷部件方面提供更大的靈活性。如果在診斷期間 HP（或 HP 服務提供商或服務合作伙伴）確定可以通過使用 CSR 部件完成維修，HP 將直接把該部件發給您進行更換。有兩類 CSR 部件：

- **強制性的** — 要求客戶必須自行維修的部件。如果您請求 HP 更換這些部件，則必須為該服務支付差旅費和人工費用。
- **可選的** — 客戶可以選擇是否自行維修的部件。這些部件也是为客户自行維修設計的。不過，如果您要求 HP 为您更换这些部件，则根据为您的产品指定的保修服务类型，HP 可能收取或不再收取任何附加費用。

注：某些 HP 部件的设计并未考虑客户自行维修。为了满足客户保修的需要，HP 要求授权服务提供商更换相关部件。这些部件在部件目录中标记为“否”。

CSR 部件将在下一个工作日发送（取决于备货情况和允许的地理范围），在允许的地理范围内，可在当天或四小时内发送，但要收取额外费用。如果需要帮助，您可以致电 HP 技术支持中心，将有技术人员通过电话为您提供帮助。HP 会在替换的 CSR 部件到货的材料中注明是否必须将有缺陷的部件退还给 HP。如果要求您将有缺陷的部件退还给 HP，那么您必须在规定期限内（通常是五 (5) 个工作日）把缺陷部件发给 HP。有缺陷的部件必须随所发送的运料中的相关文件一起返还。如果未能送还有缺陷的部件，HP 可能会要求您支付更换费用。客户自行维修时，HP 将承担所有相关运输和部件返回费用，并指定快递商/承运商。

有关 HP 客户自行维修计划的详细信息，请与您的服务提供商联系。有关北美地区的计划，请访问 HP 网站 [http://www.hp.com/go/selfrepair]。
고객 셀프 수리

HP 제품은 수리 시간을 최소화하고 결함이 있는 부품 교체 시 더욱 운용성을 높이기 위해 고객 셀프 수리(CSR) 부품을 다양 사용하여 설계되었습니다. 전담 기간 동안 HP 또는 HP 서비스 공급업체 또는 서비스 협력업체에서 CSR 부품을 사용하여 수리가 가능하다고 판단되면 HP는 해당 부품을 바로 사용자에게 보내어 사용자가 교체할 수 있도록 합니다. CSR 부품에는 두 가지 종류가 있습니다.

- 고객 셀프 수리가 의무 사항인 필수 부품: 사용자가 HP에 이 부품의 교체를 요청할 경우 이 서비스에 대한 출장비 및 적립비가 청구됩니다.
- 고객 셀프 수리가 선택 사항인 부품: 이 부품들도 고객 셀프 수리가 가능하도록 설계되었습니다. 하지만 사용자가 HP에 이 부품의 교체를 요청할 경우 사용자가 구입한 제품에 해당하는 부품 서비스 유형에 따라 추가 비용 없이 교체가 가능할 수 있습니다.

참고: 일부 HP 부품은 고객 셀프 수리가 불가능하도록 설계되었습니다. HP는 만족스러운 고객 환경을 위해 공인 서비스 제공업체를 통해 부품을 교체하도록 하고 있습니다. 이러한 부품들은 Illustrated Parts Catalog에 "No"라고 표기되어 있습니다.

CSR 부품은 제품 상태와 지리적 조건이 허용하는 경우 다음 영업일 날부터 이동사용 및 출장비가 포함한 조건으로 제공됩니다. 제품 기술가가 확인한 후 제품을 교체하도록 합니다. HP는 결함이 발생한 부품을 HP로 반환해야 하는지 여부를 CSR 교체 부품과 함께 배송된 자료에 지정합니다. 결함이 발생한 부품을 HP로 반환해야 하는 경우에는 지정된 기간 내(통상 영업일 기준 5일)에 HP로 반환해야 합니다. 이때 HP는 발생한 부품을 제공된 포장 재료에 넣어 관련 설명서와 함께 반환해야 합니다. 결함이 발생한 부품을 반환하지 않는 경우 HP가 교체 부품에 대해 비용을 청구할 수 있습니다. 고객 셀프 수리의 경우, HP는 모든 운송 및 부품 반환 비용을 부담하며 이동할 운송업체 및 맥락 서비스를 결정합니다.
